[QRH] SMOKE / FUMES / AVNCS SMOKE

Applicable to: MSN 01767-01920

Ident.: PRO-ABN-SMOKE-D-00012212.0004001 / 17 MAR 17

This procedure includes all the steps of the AVIONICS SMOKE ECAM procedure.

Apply this procedure when:
- The flight (cabin) crew suspect that smoke is coming from any of the following:
  - The avionics
  - The air conditioning
  - The cabin equipment
- Requested by the AVIONICS SMOKE ECAM procedure.
- There is a smell of smoke / fumes in the cockpit :
  - If the smell is similar to that of orange peels, suspect a toxic leak of rain repellent fluid.
  - If the smell is similar to that of pine needles, suspect a non-toxic leak.

If any other ECAM SMOKE alert triggers (CARGO, ...), the crew must first apply the ECAM procedure, then consider applying this procedure.
Note that these ECAM alerts may be caused by another source, that should usually first be detected by the flight crew/cabin crew/avionics smoke detectors.

The following explains the layout of this procedure:
- The procedure lines above the text boxes indicate the actions that the flight crew must immediately perform, if smoke is detected (with or without ECAM activation and regardless of the smoke source). These immediate actions correspond to the most common steps to be taken in smoke cases. In all cases, the flight crew must also be prepared to immediately perform a diversion. However, this diversion may be avoided if the smoke source is obvious, accessible and extinguishable or confirmed isolated (after completion of the immediate actions).
- The text boxes indicate the actions that the flight crew must consider, if at any time during the remainder of the procedure but always after the initial steps:
  - Smoke / fumes become the greatest threat and removal of smoke / fumes is required, and/or
  - The situation becomes critical and can no longer be controlled.
- The procedure lines below the text boxes indicate the actions that the flight crew must perform, as soon as they suspect a source of smoke. The actions will depend on whether the smoke is coming from the avionics, and/or air conditioning, and/or cabin equipment.

LAND ASAP

IF PERCEPTIBLE SMOKE APPLY IMMEDIATELY:

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

If smoke is confirmed, the following procedure must be applied.

OXY MASK / GOGGLE (if required).....USE/100%/EMERG

Ensure crew communication is established. Avoid continuous use of the interphone to minimize interference from the oxygen mask breathing noise.
Turn the emergency knob to remove condensation or smoke from the mask.

VENTILATION BLOWER..... OVRD
VENTILATION EXTRACT..... OVRD

Avionics ventilation air is extracted overboard.

CAB FANS.....OFF

To prevent smoke from entering the cockpit and cabin.

GALY & CAB.....OFF
SIGNS.....ON
CKPT / CABIN COM..... ESTABLISH

Communication must be established with the cabin crew in order to follow up on the smoke origin and dissipation.

- **If smoke source immediately obvious, accessible, and extinguishable:**
  FAULTY EQPT..... ISOLATE

- **If smoke source not immediately isolated:**
  DIVERSION.....INITIATE
  DESCENT TO FL 100 / MEA-MORA..... INITIATE

- **At ANY TIME of the procedure, if SMOKE / FUMES becomes the GREATEST THREAT:**
  REMOVAL OF SMOKE / FUMES.....CONSIDER

- **At ANY TIME of the procedure, if situation becomes UNMANAGEABLE:**
  IMMEDIATE LANDING.....CONSIDER
  L2 *Depending on the situation, the Captain can consider an overweight landing, a tailwind landing, a ditching, a forced landing, etc.*

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

L1 Guidelines to determine smoke source:

- If smoke initially comes out of the ventilation outlets, the crew may suspect AIR COND SMOKE. In addition, very shortly thereafter, several SMOKE warnings (cargo, lavatory, avionics) will be triggered. The displayed ECAM procedures must be applied.
- After an ENG or APU failure, smoke may come from the faulty item via the bleed system and be perceived in the cockpit and/or cabin. In such a case, it will be recirculated throughout the aircraft, until it completely disappears from the air conditioning system.
- If only the AVIONICS SMOKE warning is triggered, the crew may suspect avionics smoke.
- If the smoke is detected while an equipment is declared faulty, the crew may suspect that smoke is coming from this equipment.
- Avionics or forward galley smoke may be smelt, or may enter in the cockpit before ECAM warning activation.

TO SET ELEC EMER CONFIG

EMER ELEC GEN 1 LINE.....OFF

GEN 1 LINE contactor opens. GEN 1 remains running and supplies one fuel pump in each wing tank. AC BUS 1 is supplied by GEN 2 through the bus tie contactor.

EMER ELEC PWR.....MAN ON

RAT is extended and the EMER GEN is connected to the aircraft network. Check emergency generator parameters on the ELEC SD page (displayed automatically).

- **When EMER GEN AVAIL:**

  APU GEN.....OFF
  GEN 2.....OFF
  ELEC EMER CONFIG

  Two different procedures can be displayed on the ECAM, depending on whether the AVIONICS SMOKE ECAM caution is triggered or not before the flight crew sets the electrical emergency configuration.

  - **If AVIONICS SMOKE not triggered:**

    APPLY ELEC EMER CONFIG PROCEDURE, BUT DO NOT RESET GEN, EVEN IF REQUESTED BY ECAM

    - **At 3 min or 2 000 ft AAL before landing:**

      Restore all generators only 3 min before landing or at 2 000 ft AAL to recover normal braking, while minimizing possible reactivation of a smoke source.

      GEN 2.....ON
      EMER ELEC GEN 1 LINE.....ON

    - **When aircraft stopped:**

      ALL GENs.....OFF

  - **If AVIONICS SMOKE triggered:**

    The ECAM displays a specific ELEC EMER CONFIG procedure. The flight crew must apply the following ECAM procedure.

    MIN RAT SPEED.....140 KT

    Note: The electrical configuration is the same as for loss of both generators (except that one fuel pump in each wing tank remains supplied).

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

VHF 1 / HF 1 / ATC 1..... USE

Only VHF 1, HF 1 and ATC 1 are supplied in this configuration. Notify the ATC of the nature of the emergency, and state intentions. If there is no contact with the ATC, switch to code A7700, or transmit a distress message on one of the emergency frequencies.

FAC 1..... OFF THEN ON

Rudder trim is recovered, despite the fact that no indication is available.

- **At 3 min or 2 000 ft AAL before landing:**

  Restore all generators only 3 min before landing or at 2 000 ft AAL to recover normal braking, while minimizing possible reactivation of a smoke source.

  GEN 2..... ON
  EMER ELEC GEN 1 LINE..... ON

F/CTL ALTN LAW (PROT LOST)

Flight control normal laws and associated protections are lost. Only the load factor limitation, and the high and low speed stability remain (ALTN law with reduced protection).

MAX SPEED.....320 KT

Note: *Depending on the value of the engine total air temperature, the "EPR FAULT MODE" may be triggered, resulting in the degraded N1 MODE for both engines.*

[QRH] SMOKE / FUMES / AVNCS SMOKE - GENERAL (Cont'd)

Ident.: PRO-ABN-SMOKE-D-00012212.0004001 / 17 MAR 17

This procedure includes all the steps of the AVIONICS SMOKE ECAM procedure.

Apply this procedure when:
- The flight (cabin) crew suspect that smoke is coming from any of the following:
  - The avionics
  - The air conditioning
  - The cabin equipment
- Requested by the AVIONICS SMOKE ECAM procedure.
- There is a smell of smoke / fumes in the cockpit :
  - If the smell is similar to that of orange peels, suspect a toxic leak of rain repellent fluid.
  - If the smell is similar to that of pine needles, suspect a non-toxic leak.

If any other ECAM SMOKE alert triggers (CARGO, ...), the crew must first apply the ECAM procedure, then consider applying this procedure.
Note that these ECAM alerts may be caused by another source, that should usually first be detected by the flight crew/cabin crew/avionics smoke detectors.

The following explains the layout of this procedure:
- The procedure lines above the text boxes indicate the actions that the flight crew must immediately perform, if smoke is detected (with or without ECAM activation and regardless of the smoke source). These immediate actions correspond to the most common steps to be taken in smoke cases. In all cases, the flight crew must also be prepared to immediately perform a diversion. However, this diversion may be avoided if the smoke source is obvious, accessible and extinguishable or confirmed isolated (after completion of the immediate actions).
- The text boxes indicate the actions that the flight crew must consider, if at any time during the remainder of the procedure but always after the initial steps:
  - Smoke / fumes become the greatest threat and removal of smoke / fumes is required, and/or
  - The situation becomes critical and can no longer be controlled.
- The procedure lines below the text boxes indicate the actions that the flight crew must perform, as soon as they suspect a source of smoke. The actions will depend on whether the smoke is coming from the avionics, and/or air conditioning, and/or cabin equipment.

LAND ASAP

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE - GENERAL (Cont'd)

IF PERCEPTIBLE SMOKE APPLY IMMEDIATELY:

If smoke is confirmed, the following procedure must be applied.

OXY MASK / GOGGLE (if required).....USE/100%/EMERG

Ensure crew communication is established. Avoid continuous use of the interphone to minimize interference from the oxygen mask breathing noise.
Turn the emergency knob to remove condensation or smoke from the mask.

VENTILATION BLOWER..... OVRD
VENTILATION EXTRACT..... OVRD

Avionics ventilation air is extracted overboard.

CAB FANS.....OFF

To prevent smoke from entering the cockpit and cabin.

GALY & CAB.....OFF
SIGNS.....ON
CKPT / CABIN COM..... ESTABLISH

Communication must be established with the cabin crew in order to follow up on the smoke origin and dissipation.

- **If smoke source immediately obvious, accessible, and extinguishable:**

  IMMEDIATE LANDING.....CONSIDER

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE - GENERAL (Cont'd)

L2 *Depending on the situation, the Captain can consider an overweight landing, a tailwind landing, a ditching, a forced landing, etc.*

L1 Guidelines to determine smoke source:

- If smoke initially comes out of the ventilation outlets, the crew may suspect AIR COND SMOKE. In addition, very shortly thereafter, several SMOKE warnings (cargo, lavatory, avionics) will be triggered. The displayed ECAM procedures must be applied.
- After an ENG or APU failure, smoke may come from the faulty item via the bleed system and be perceived in the cockpit and/or cabin. In such a case, it will be recirculated throughout the aircraft, until it completely disappears from the air conditioning system.
- If only the AVIONICS SMOKE warning is triggered, the crew may suspect avionics smoke.
- If the smoke is detected while an equipment is declared faulty, the crew may suspect that smoke is coming from this equipment.
- Avionics or forward galley smoke may be smelt, or may enter in the cockpit before ECAM warning activation.

[QRH] SMOKE / FUMES / AVNCS SMOKE

Applicable to: MSN 04294, 04433

Ident.: PRO-ABN-SMOKE-D-00012212.0004001 / 17 MAR 17

This procedure includes all the steps of the AVIONICS SMOKE ECAM procedure.

Apply this procedure when:
- The flight (cabin) crew suspect that smoke is coming from any of the following:
  - The avionics
  - The air conditioning
  - The cabin equipment
- Requested by the AVIONICS SMOKE ECAM procedure.
- There is a smell of smoke / fumes in the cockpit :
  - If the smell is similar to that of orange peels, suspect a toxic leak of rain repellent fluid.
  - If the smell is similar to that of pine needles, suspect a non-toxic leak.

If any other ECAM SMOKE alert triggers (CARGO, ...), the crew must first apply the ECAM procedure, then consider applying this procedure.
Note that these ECAM alerts may be caused by another source, that should usually first be detected by the flight crew/cabin crew/avionics smoke detectors.

The following explains the layout of this procedure:
- The procedure lines above the text boxes indicate the actions that the flight crew must immediately perform, if smoke is detected (with or without ECAM activation and regardless of the smoke source). These immediate actions correspond to the most common steps to be taken in smoke cases. In all cases, the flight crew must also be prepared to immediately perform a diversion. However, this diversion may be avoided if the smoke source is obvious, accessible and extinguishable or confirmed isolated (after completion of the immediate actions).
- The text boxes indicate the actions that the flight crew must consider, if at any time during the remainder of the procedure but always after the initial steps:
  - Smoke / fumes become the greatest threat and removal of smoke / fumes is required, and/or
  - The situation becomes critical and can no longer be controlled.
- The procedure lines below the text boxes indicate the actions that the flight crew must perform, as soon as they suspect a source of smoke. The actions will depend on whether the smoke is coming from the avionics, and/or air conditioning, and/or cabin equipment.

LAND ASAP

IF PERCEPTIBLE SMOKE APPLY IMMEDIATELY:

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

If smoke is confirmed, the following procedure must be applied.

OXY MASK / GOGGLE (if required).....USE/100%/EMERG

Ensure crew communication is established. Avoid continuous use of the interphone to minimize interference from the oxygen mask breathing noise.
Turn the emergency knob to remove condensation or smoke from the mask.

VENTILATION BLOWER..... OVRD
VENTILATION EXTRACT..... OVRD

Avionics ventilation air is extracted overboard.

CAB FANS.....OFF

To prevent smoke from entering the cockpit and cabin.

GALY & CAB.....OFF
SIGNS.....ON
CKPT / CABIN COM..... ESTABLISH

Communication must be established with the cabin crew in order to follow up on the smoke origin and dissipation.

- **If smoke source immediately obvious, accessible, and extinguishable:**
  FAULTY EQPT..... ISOLATE

- **If smoke source not immediately isolated:**
  DIVERSION.....INITIATE
  DESCENT TO FL 100 / MEA-MORA..... INITIATE

- **At ANY TIME of the procedure, if SMOKE / FUMES becomes the GREATEST THREAT:**
  REMOVAL OF SMOKE / FUMES.....CONSIDER
  Refer to PRO-ABN-SMOKE [QRH] REMOVAL OF SMOKE / FUMES
  ELEC EMER CONFIG.....CONSIDER
  Refer to PRO-ABN-SMOKE [QRH] SMOKE / FUMES / AVNCS SMOKE - ELEC EMER CONFIG

- **At ANY TIME of the procedure, if situation becomes UNMANAGEABLE:**
  IMMEDIATE LANDING.....CONSIDER

L2 *Depending on the situation, the Captain can consider an overweight landing, a tailwind landing, a ditching, a forced landing, etc.*

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

L1 Guidelines to determine smoke source:

- If smoke initially comes out of the ventilation outlets, the crew may suspect AIR COND SMOKE. In addition, very shortly thereafter, several SMOKE warnings (cargo, lavatory, avionics) will be triggered. The displayed ECAM procedures must be applied.
- After an ENG or APU failure, smoke may come from the faulty item via the bleed system and be perceived in the cockpit and/or cabin. In such a case, it will be recirculated throughout the aircraft, until it completely disappears from the air conditioning system.
- If only the AVIONICS SMOKE warning is triggered, the crew may suspect avionics smoke.
- If the smoke is detected while an equipment is declared faulty, the crew may suspect that smoke is coming from this equipment.
- Avionics or forward galley smoke may be smelt, or may enter in the cockpit before ECAM warning activation.

TO SET ELEC EMER CONFIG

EMER ELEC GEN 1 LINE.....OFF

GEN 1 LINE contactor opens. GEN 1 remains running and supplies one fuel pump in each wing tank. AC BUS 1 is supplied by GEN 2 through the bus tie contactor.

EMER ELEC PWR.....MAN ON

RAT is extended and the EMER GEN is connected to the aircraft network. Check emergency generator parameters on the ELEC SD page (displayed automatically).

- **When EMER GEN AVAIL:**

  APU GEN.....OFF
  GEN 2.....OFF
  ELEC EMER CONFIG

  Two different procedures can be displayed on the ECAM, depending on whether the AVIONICS SMOKE ECAM caution is triggered or not before the flight crew sets the electrical emergency configuration.

  - **If AVIONICS SMOKE not triggered:**

    APPLY ELEC EMER CONFIG PROCEDURE, BUT DO NOT RESET GEN, EVEN IF REQUESTED BY ECAM

    - **At 3 min or 2 000 ft AAL before landing:**

      Restore all generators only 3 min before landing or at 2 000 ft AAL to recover normal braking, while minimizing possible reactivation of a smoke source.

      GEN 2.....ON
      EMER ELEC GEN 1 LINE.....ON

    - **When aircraft stopped:**

      ALL GENs.....OFF

  - **If AVIONICS SMOKE triggered:**

    The ECAM displays a specific ELEC EMER CONFIG procedure. The flight crew must apply the following ECAM procedure.

    MIN RAT SPEED.....140 KT

    Note: The electrical configuration is the same as for loss of both generators (except that one fuel pump in each wing tank remains supplied).

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

VHF 1 / HF 1 / ATC 1..... USE

Only VHF 1, HF 1 and ATC 1 are supplied in this configuration. Notify the ATC of the nature of the emergency, and state intentions. If there is no contact with the ATC, switch to code A7700, or transmit a distress message on one of the emergency frequencies.

FAC 1..... OFF THEN ON

Rudder trim is recovered, despite the fact that no indication is available.

- **At 3 min or 2 000 ft AAL before landing:**

  Restore all generators only 3 min before landing or at 2 000 ft AAL to recover normal braking, while minimizing possible reactivation of a smoke source.

  GEN 2..... ON
  EMER ELEC GEN 1 LINE..... ON

F/CTL ALTN LAW (PROT LOST)

Flight control normal laws and associated protections are lost. Only the load factor limitation, and the high and low speed stability remain (ALTN law with reduced protection).

MAX SPEED.....320 KT

17

TO SET ELEC EMER CONFIG

EMER ELEC GEN 1 LINE.....OFF

GEN 1 LINE contactor opens. GEN 1 remains running and supplies one fuel pump in each wing tank. AC BUS 1 is supplied by GEN 2 through the bus tie contactor.

EMER ELEC PWR.....MAN ON

RAT is extended and the EMER GEN is connected to the aircraft network. Check emergency generator parameters on the ELEC SD page (displayed automatically).

- **When EMER GEN AVAIL:**

  APU GEN.....OFF
  GEN 2.....OFF
  ELEC EMER CONFIG

  Two different procedures can be displayed on the ECAM, depending on whether the AVIONICS SMOKE ECAM caution is triggered or not before the flight crew sets the electrical emergency configuration.

  - **If AVIONICS SMOKE not triggered:**

    APPLY ELEC EMER CONFIG PROCEDURE, BUT DO NOT RESET GEN, EVEN IF REQUESTED BY ECAM

    - **At 3 min or 2 000 ft AAL before landing:**

      Restore all generators only 3 min before landing or at 2 000 ft AAL to recover normal braking, while minimizing possible reactivation of a smoke source.

      GEN 2.....ON
      EMER ELEC GEN 1 LINE.....ON

    - **When aircraft stopped:**

      ALL GENs.....OFF

  - **If AVIONICS SMOKE triggered:**

    The ECAM displays a specific ELEC EMER CONFIG procedure. The flight crew must apply the following ECAM procedure.

    MIN RAT SPEED.....140 KT

    Note: The electrical configuration is the same as for loss of both generators (except that one fuel pump in each wing tank remains supplied).

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

VHF 1 / HF 1 / ATC 1..... USE

Only VHF 1, HF 1 and ATC 1 are supplied in this configuration. Notify the ATC of the nature of the emergency, and state intentions. If there is no contact with the ATC, switch to code A7700, or transmit a distress message on one of the emergency frequencies.

FAC 1..... OFF THEN ON

Rudder trim is recovered, despite the fact that no indication is available.

- **At 3 min or 2 000 ft AAL before landing:**

  Restore all generators only 3 min before landing or at 2 000 ft AAL to recover normal braking, while minimizing possible reactivation of a smoke source.

  GEN 2..... ON
  EMER ELEC GEN 1 LINE..... ON

F/CTL ALTN LAW (PROT LOST)

Flight control normal laws and associated protections are lost. Only the load factor limitation, and the high and low speed stability remain (ALTN law with reduced protection).

MAX SPEED.....320 KT

Note: Depending on the value of the engine total air temperature, the "EPR FAULT MODE" may be triggered, resulting in the degraded N1 MODE for both engines.

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE

Applicable to: MSN 06720-09063

Ident.: PRO-ABN-SMOKE-D-00012212.0004001 / 17 MAR 17

This procedure includes all the steps of the AVIONICS SMOKE ECAM procedure.

Apply this procedure when:

- The flight (cabin) crew suspect that smoke is coming from any of the following:
  - The avionics
  - The air conditioning
  - The cabin equipment
- Requested by the AVIONICS SMOKE ECAM procedure.
- There is a smell of smoke / fumes in the cockpit :
  - If the smell is similar to that of orange peels, suspect a toxic leak of rain repellent fluid.
  - If the smell is similar to that of pine needles, suspect a non-toxic leak.

If any other ECAM SMOKE alert triggers (CARGO, ...), the crew must first apply the ECAM procedure, then consider applying this procedure.
Note that these ECAM alerts may be caused by another source, that should usually first be detected by the flight crew/cabin crew/avionics smoke detectors.

The following explains the layout of this procedure:

- The procedure lines above the text boxes indicate the actions that the flight crew must immediately perform, if smoke is detected (with or without ECAM activation and regardless of the smoke source). These immediate actions correspond to the most common steps to be taken in smoke cases. In all cases, the flight crew must also be prepared to immediately perform a diversion. However, this diversion may be avoided if the smoke source is obvious, accessible and extinguishable or confirmed isolated (after completion of the immediate actions).
- The text boxes indicate the actions that the flight crew must consider, if at any time during the remainder of the procedure but always after the initial steps:
  - Smoke / fumes become the greatest threat and removal of smoke / fumes is required, and/or
  - The situation becomes critical and can no longer be controlled.
- The procedure lines below the text boxes indicate the actions that the flight crew must perform, as soon as they suspect a source of smoke. The actions will depend on whether the smoke is coming from the avionics, and/or air conditioning, and/or cabin equipment.

LAND ASAP

IF PERCEPTIBLE SMOKE APPLY IMMEDIATELY:

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

If smoke is confirmed, the following procedure must be applied.

OXY MASK / GOGGLE (if required).....USE/100%/EMERG

Ensure crew communication is established. Avoid continuous use of the interphone to minimize interference from the oxygen mask breathing noise.
Turn the emergency knob to remove condensation or smoke from the mask.

VENTILATION BLOWER..... OVRD
VENTILATION EXTRACT..... OVRD

Avionics ventilation air is extracted overboard.

CAB FANS.....OFF

To prevent smoke from entering the cockpit and cabin.

GALY & CAB.....OFF
SIGNS.....ON
CKPT / CABIN COM..... ESTABLISH

Communication must be established with the cabin crew in order to follow up on the smoke origin and dissipation.

- **If smoke source immediately obvious, accessible, and extinguishable:**
  FAULTY EQPT..... ISOLATE

- **If smoke source not immediately isolated:**
  DIVERSION.....INITIATE
  DESCENT TO FL 100 / MEA-MORA..... INITIATE

- **At ANY TIME of the procedure, if SMOKE / FUMES becomes the GREATEST THREAT:**
  REMOVAL OF SMOKE / FUMES.....CONSIDER
  Refer to PRO-ABN-SMOKE [QRH] REMOVAL OF SMOKE / FUMES
  ELEC EMER CONFIG.....CONSIDER
  Refer to PRO-ABN-SMOKE [QRH] SMOKE / FUMES / AVNCS SMOKE - ELEC EMER CONFIG

- **At ANY TIME of the procedure, if situation becomes UNMANAGEABLE:**
  IMMEDIATE LANDING.....CONSIDER

L2 *Depending on the situation, the Captain can consider an overweight landing, a tailwind landing, a ditching, a forced landing, etc.*

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

L1 Guidelines to determine smoke source:

- If smoke initially comes out of the ventilation outlets, the crew may suspect AIR COND SMOKE. In addition, very shortly thereafter, several SMOKE warnings (cargo, lavatory, avionics) will be triggered. The displayed ECAM procedures must be applied.
- After an ENG or APU failure, smoke may come from the faulty item via the bleed system and be perceived in the cockpit and/or cabin. In such a case, it will be recirculated throughout the aircraft, until it completely disappears from the air conditioning system.
- If only the AVIONICS SMOKE warning is triggered, the crew may suspect avionics smoke.
- If the smoke is detected while an equipment is declared faulty, the crew may suspect that smoke is coming from this equipment.
- Avionics or forward galley smoke may be smelt, or may enter in the cockpit before ECAM warning activation.

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

[QRH] REMOVAL OF SMOKE / FUMES

Ident.: PRO-ABN-SMOKE-00012218.0001001 / 17 MAR 17
Applicable to: MSN 01767-02405, 02482

Apply the REMOVAL OF SMOKE / FUMES QRH procedure, if smoke / fumes become the greatest threat when applying the SMOKE / FUMES / AVNCS SMOKE QRH procedure.

EMER EXIT LIGHT.....ON

■ **If fuel vapors:**

CAB FANS.....ON

The recirculating air ventilates the air mixer bay and other fuselage area. This prevents fuel vapors from accumulating and the risk of explosion. Passenger health is not affected.

PACK 1.....OFF
PACK 2.....OFF

■ **If no fuel vapors:**

CAB FANS.....OFF

To prevent smoke from entering the cockpit and cabin.

PACK FLOW.....HI

To provide maximum airflow from the packs.
Do not shut down the air conditioning packs, and do not reduce ventilation in an attempt to smother the fire.
Do not deploy oxygen masks, if fire is suspected in the cabin.

LDG ELEV.....10 000 ft / MEA-MORA
DESCENT TO FL 100 / MEA-MORA.....INITIATE

The most effective means of smoke removal is use of ram air. Therefore, descent is initiated to FL 100 or the MEA-MORA, while the cabin altitude is increased to 10 000 ft or the MEA-MORA. The increase in cabin altitude also reduces, at least temporarily, the smoke concentration. Cabin depressurization starts, when descent is initiated.

ATC.....NOTIFY
SMOKE / FUMES / AVNCS SMOKE PROC.....CONTINUE

Refer to PRO-ABN-SMOKE [QRH] SMOKE / FUMES / AVNCS SMOKE - GENERAL

● **At FL 100 or MEA-MORA:**

● **If in ELEC EMER CONFIG:**

APU MASTER sw .....ON

Continued on the following page

[QRH] REMOVAL OF SMOKE / FUMES (Cont'd)

In electrical emergency configuration, when the APU MASTER sw is ON, the battery contactors will automatically close for a maximum of 3 min. This will enable the flight crew to manually control the outflow valve that is powered by the DC BAT BUS.

PACK 1 ..... OFF
PACK 2 ..... OFF

In electrical emergency configuration, the PACK 2 flow control valve cannot close because it is not electrically supplied. Therefore PACK 2 remains operative even when PACK 2 pb is set to OFF.

MODE SEL ..... MAN
MAN V/S CTL ..... FULL UP
RAM AIR ..... ON

At FL 100, or MEA-MORA, it is possible to open the RAM AIR valve when ΔP is 1 PSI or below. Opening the RAM AIR enables flying with both packs OFF.

APU MASTER sw ..... OFF

- **If smoke persists:**

  If there is smoke in the cockpit, open the cockpit (CKPT) window to evacuate the smoke.

  MAX SPEED: 200 kt
  COCKPIT DOOR ..... OPEN
  HEADSETS ..... ON
  PM SLIDING WINDOW ..... OPEN

  - **When window open:**
    NON-AFFECTED PACK(s) ..... ON
    VISUAL WARNINGS (noisy CKPT) ..... MONITOR

    Due to the increased noise level, pay particular attention to visual warnings.

    SMOKE / FUMES / AVNCS SMOKE PROC ..... CONTINUE

    Refer to PRO-ABN-SMOKE [QRH] SMOKE / FUMES / AVNCS SMOKE - GENERAL

[MEM] TCAS WARNINGS

Ident.: PRO-ABN-SURV-00012455.0031001 / 17 MAR 17

3 **Applicable to: MSN 06904, 06946, 07083-07192, 07504-09063**

■ **Traffic Advisory (TA) alert:**

TCAS mode.....CHECK ARMED

Check that the TCAS flight guidance mode arms (TCAS blue). If not, the flight crew must be prepared to manually follow the Resolution Advisory orders.

● **If the A/THR is off:**

A/THR.....ON

The flight crew should set the A/THR to ON to avoid the triggering of the AUTO FLT A/THR LIMITED alert at the A/THR activation, in the case of a RA.

Do not perform a maneuver based on a TA alone.

■ **Resolution Advisory (RA) alert:**

■ **If TCAS flight guidance mode is available:**

The flight crew applies this procedure, when a RA is triggered, and the TCAS mode engages. The TCAS mode follows the RA orders.

● **If AP OFF:**

FD ORDERs..... FOLLOW

The AP can be engaged.

VERTICAL SPEED.....MONITOR

If a preventive RA was triggered: Check that the vertical speed remains out of the red area of the vertical speed scale.
If a corrective RA was triggered: Check that the vertical speed gets out of the red area, and remains in the green area of the vertical speed scale.

CAUTION	If for any reason during a RA, the aircraft vertical speed does not reach the green area of the vertical speed scale, the Pilot Flying (PF) should disconnect the AP, and override the FD orders, in order to lead the aircraft vertical speed out of the red area of the vertical speed scale. If necessary, the PF must use the full speed range between Vαmax and Vmax.

● **If any "CLIMB" aural alert sounds during the final approach:**

TCAS MODE ORDERs.....MONITOR/FOLLOW
GO-AROUND..... CONSIDER

If the flight crew performs a go-around, the TCAS mode disengages and the SRS mode engages. The AP/FD does no longer follow the RA orders. In any case, check

Continued on the following page

[MEM] TCAS WARNINGS (Cont'd)

that the vertical speed gets out of the red area, and remains in the green area of the vertical speed scale.

Respect STALL, GPWS or WINDSHEAR WARNING.
ATC.....NOTIFY

- **When "CLEAR OF CONFLICT" aural alert sounds:**

  If engaged, the TCAS mode disengages:

  AP/FD.....MONITOR/FOLLOW
  ATC.....NOTIFY
  LATERAL AND VERTICAL GUIDANCE.....ADJUST

  The flight crew should engage an appropriate vertical mode, or adjust the vertical speed target, in accordance with the latest ATC clearance.

  SPEED.....ADJUST

  The flight crew should adjust the speed target, and revert to managed speed, as appropriate.

■ **If TCAS flight guidance mode is NOT available:**

The flight crew applies this procedure, when a RA is triggered, and the TCAS mode does not engage.

AP (if engaged).....OFF
BOTH FDs.....OFF
Respond promptly and smoothly
VERTICAL SPEED.....ADJUST or MAINTAIN

Adjust or maintain the pitch as required, to reach the green area and/or avoid the red area of the vertical speed scale.

Note: *Avoid excessive maneuvers while attempting to maintain the vertical speed just outside the red area of the VSI, and within the green area. If necessary, use the full speed range between Vαmax and Vmax.*

- **If any "CLIMB" aural alert sounds during the final approach:**
  GO-AROUND.....PERFORM

Respect STALL, GPWS or WINDSHEAR WARNING:
ATC.....NOTIFY

- **When "CLEAR OF CONFLICT" aural alert sounds:**
  ATC.....NOTIFY
  LATERAL AND VERTICAL GUIDANCE.....ADJUST

Continued on the following page

[MEM] TCAS WARNINGS (Cont'd)

Adjust the lateral and vertical guidance to resume normal navigation, in accordance with ATC clearance;

AP/FD..... AS RQRD

If necessary, reengage the AP/FD.

[MEM] TCAS WARNINGS

Resume normal navigation in accordance with ATC clearance.
AP/FD can be reengaged as desired.

[MEM] WINDSHEAR

Ident.: PRO-ABN-SURV-00012271.0002001 / 30 AUG 18
Applicable to: ALL

If Windshear is detected, both PFDs display a "WINDSHEAR" message with a red flag. An associated aural WINDSHEAR alert sounds three times.
If either the flight crew or the WX system detects WINDSHEAR, apply the following recovery technique:

- **At Takeoff:**
  - **If before V1:**

    The takeoff should be rejected only if significant airspeed variations occur below indicated V1 and the Captain decides that there is sufficient runway remaining to stop the airplane.

  - **If after V1:**

    THR LEVERS.....TOGA
    REACHING VR.....ROTATE
    SRS ORDERS..... FOLLOW

    If necessary the flight crew may pull the sidestick fully back.

    Note: If the FD bars are not displayed, move toward an initial pitch attitude of 17.5 °. Then, if necessary, to prevent a loss in altitude, increase the pitch attitude.

- **Airborne, initial climb or landing:**

  THR LEVERS AT TOGA..... SET OR CONFIRM
  AP (if engaged)..... KEEP ON
  SRS ORDERS.....FOLLOW

  If necessary the flight crew may pull the sidestick fully back.

  Note: 1. Autopilot disengages if the angle of attack value goes above α prot.
  2. If the FD bars are not displayed, move toward an initial pitch attitude of 17.5 °. Then, if necessary, to prevent a loss in altitude, increase the pitch attitude.

  DO NOT CHANGE CONFIGURATION (SLATS/FLAPS, GEAR) UNTIL OUT OF WINDSHEAR.
  CLOSELY MONITOR FLIGHT PATH AND SPEED.
  RECOVER SMOOTHLY TO NORMAL CLIMB OUT OF WINDSHEAR.

[MEM] WINDSHEAR AHEAD

Ident.: PRO-ABN-SURV-00012272.0001001 / 04 SEP 18

Applicable to: MSN 01767-02334, 02388, 02443-02457, 02584-09063

The "W/S AHEAD" message is displayed on each PFD. The color of the message depends on the severity and location of the windshear

Note: When a predictive windshear alert ("WINDSHEAR AHEAD" or "GO AROUND WINDSHEAR AHEAD") is triggered, the flight crew must carefully check that there is no hazard. If this is the case, the flight crew can disregard the alert, as long as both of the following apply:

- *There are no other signs of possible windshear conditions*
- *The reactive windshear system is operational.*

Known cases of spurious predictive windshear alerts were reported at some airports, either during takeoff or landing, due to the specific obstacle environment. However, always rely on any reactive windshear ("WINDSHEAR").

W/S AHEAD RED

■ Takeoff

Associated with an aural synthetic voice "WINDSHEAR AHEAD, WINDSHEAR AHEAD".

- **Before takeoff:**
  Delay takeoff, or select the most favorable runway.
- **During the takeoff run:**

Reject takeoff.

Note: Predictive windshear alerts are inhibited above 100 kt until 50 ft.

- **When airborne:**

THR LEVERS.....TOGA

As usual, the slat/flap configuration can be changed, provided the windshear is not entered.

AP (if engaged).....KEEP ON SRS ORDERS..... FOLLOW

If necessary the flight crew may pull the sidestick fully back.

Note: 1. Autopilot disengages if the angle of attack value goes above α prot.

Continued on the following page

[MEM] WINDSHEAR AHEAD (Cont'd)

2. If the FD bars are not displayed, move toward an initial pitch attitude of 17.5 °. Then, if necessary, to prevent a loss in altitude, increase the pitch attitude.

■ **Landing:**

Associated with an aural synthetic voice “GO AROUND, WINDSHEAR AHEAD”.

GO-AROUND	PERFORM
AP (if engaged)	KEEP ON

If necessary the flight crew may pull the sidestick fully back.

Note: 1. Autopilot disengages if the angle of attack value goes above α prot.
2. If the FD bars are not displayed, move toward an initial pitch attitude of 17.5 °. Then, if necessary, to prevent a loss in altitude, increase the pitch attitude.

GENERAL

Ident.: PRO-ABN-90-00010415.0001001 / 15 OCT 12
Applicable to: ALL

A successful outcome for an emergency situation depends, first of all, upon each crew member's perfect knowledge and execution of the duties assigned to him.
The captain should check frequently that all crew members know exactly their assigned positions and their specific duties, as well as the duties of the other crew members, in case of an abnormal or an emergency condition.
Since it is not possible to cover all the situations that may occur, the captain will be responsible for adapting the following instructions to obtain the best coordination of the emergency operation.
Should it be physically impossible for the captain to carry out his duties, another crew member will substitute for him according to the chain of command. The procedures in this manual are AIRBUS procedures and should be considered to be a reference.

COCKPIT-ASSIGNED DUTIES FOR EVACUATION

Ident.: PRO-ABN-90-00010416.0001001 / 05 AUG 10
Applicable to: ALL

■ **If it is NOT POSSIBLE to reach the passenger cabin:**

The cockpit crew should evacuate the aircraft via the cockpit clearview windows, by using the escape ropes.

On ground, each crewmember must help passengers, and direct them away from the aircraft.

■ **If it is POSSIBLE to reach the passenger cabin:**

CAPT	- Is the last person to leave the cockpit: Proceeds to the cabin, and helps with passenger evacuation, as necessary - Is the last person to leave the aircraft: Checks that all persons have evacuated the aircraft - Evacuates the aircraft, via the rear door, or any other available exit, if he/she cannot reach the rear door. - On ground, he/she takes command of operations until rescue units arrive.
F/O	- Proceeds to the cabin, and takes the emergency equipment. - Evacuates the aircraft, using any available exit. - Helps passengers on ground, and directs them away from the aircraft.

CABIN CREW-ASSIGNED AREAS FOR EVACUATION

Ident.: PRO-ABN-90-00010607.0004001 / 09 MAR 18

1 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

CABIN CREW DESIGNATION	ASSIGNED DOOR	ASSIGNED JUMPSEAT	ASSIGNED AREA
1 PURSER	DOOR 1 LH	FWD INBOARD	FWD/MID
1 CABIN CREW	DOOR 1 LH/RH	FWD/MID	FWD/MID
1 CABIN CREW	DOOR 3	AFT/MID	MID/AFT
1 CABIN CREW	DOOR 4 LH	AFT LH	MID/AFT
1 CABIN CREW	DOOR 4 RH	AFT RH	MID/AFT

Note: These procedures are established for the minimum required number of 5 cabin crews. For customized seating configurations of 200 passenger seats or less, the minimum required cabin crew can be reduced to 4 (ORO.CC.100). However, one cabin crew must be seated on the center cabin attendant seat (if installed) to ensure the direct view.

CABIN CREW-ASSIGNED AREAS FOR EVACUATION

2 **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

CABIN CREW DESIGNATION	ASSIGNED DOOR	ASSIGNED JUMPSEAT	ASSIGNED AREA
1 PURSER	DOOR 1 LH	FWD OUTBOARD	FWD/MID
1 CABIN CREW	DOOR 1 RH/LH	FWD INBOARD	FWD/MID
1 CABIN CREW	DOOR 4 RH	AFT CENTER	MID/AFT
1 CABIN CREW	DOOR 4 LH	REARWARD	MID/AFT

Note: These procedures are established for the minimum required number of 4 cabin crews. At least, one crewmember must be seated on the center swivel cabin attendant seat (if installed).

COMMUNICATIONS

Ident.: PRO-ABN-90-00010418.0001001 / 27 FEB 18
Applicable to: ALL

1. EMERGENCY CALL

FROM	TO	COMMUNICATION METHOD(S)	REMARKS
COCKPIT	CABIN	- Press EMER pb-sw on the CALLS panel, or - Passenger Address (PA) System: "PURSER TO COCKPIT PLEASE!"	Purser must immediately go to the cockpit.
CABIN	COCKPIT	- Interphone: "PRIO CAPT"	Any cabin crewmember can make such a call. The cockpit crew must reply.

2. EMERGENCY ALERT

FROM	TO	COMMUNICATION METHOD(S)	REMARKS
COCKPIT	CABIN	- PA System: "ATTENTION CREW! AT STATIONS!"	The cockpit crew makes a short and precise announcement to warn that an emergency evacuation may soon be required. Cabin crews must proceed to their emergency stations.

3. NOTIFICATION TO PASSENGERS

FROM	TO	COMMUNICATION METHOD(S)	REMARKS
COCKPIT	CABIN	- SIGNS ON - PA System	For psychological reasons, the cockpit crew should be the first to inform of an intended emergency landing.
PURSER	CABIN	- CABIN LIGHTS 100 % - PA System	Purser informs passengers that they have to pay special attention to these warnings: - "FINISH PREPARATION" - "BRACE FOR IMPACT" - "EVACUATE, EVACUATE"

4. FINISH PREPARATION			
FROM	**TO**	**COMMUNICATION METHOD(S)**	**REMARKS**
COCKPIT	CABIN	- Passenger Address (PA) System: "FINISH PREPARATION"	The cockpit crew gives this order a short time before an emergency landing.

5. BRACE FOR IMPACT			
FROM	**TO**	**COMMUNICATION METHOD(S)**	**REMARKS**
COCKPIT	CABIN	- PA System: "BRACE FOR IMPACT!"	The cockpit crew announces to brace for impact approximately 1 min before landing.

6. INITIATE EVACUATION (RESTRICTED EXITS)			
FROM	**TO**	**COMMUNICATION METHOD(S)**	**REMARKS**
COCKPIT	CABIN	- PA System: "EVACUATE, EVACUATE" - Activate EVAC signals	The cockpit crew orders an immediate evacuation, and the cabin crew directs passengers to all available exists.
CABIN	COCKPIT AND CABIN	- EVAC SIGNAL SYSTEM on FWD ATTND panel (FAP) - PA System or megaphone	Used by the cabin crew, if there is no signal or order from the cockpit, and if it is unmistakably clear that the aircraft must be evacuated.
CABIN	CABIN	- Verbal	The cabin crew stands up and shouts: - "SEATBELTS OFF!" - "LEAVE EVERYTHING!" - "GET OUT!" - "COME THIS WAY!"

7. EVACUATION NOT REQUIRED			
FROM	**TO**	**COMMUNICATION METHOD(S)**	**REMARKS**
COCKPIT	CABIN	- PA System: "CABIN CREW and PASSENGERS REMAIN SEATED!"	When the Captain decides that an evacuation is not required, the cockpit crew makes an immediate announcement to this effect.

ON GROUND EVACUATION

Ident.: PRO-ABN-90-A-00010419.0001001 / 16 JAN 18

3 **Applicable to: MSN 01767-02334, 02388, 02443-02457, 02584-09063**

COCKPIT CREW PROCEDURES

The cockpit crew notifies the cabin crew of the nature of the emergency, and states intentions. The cockpit crew uses the Passenger Address system to make an appropriate announcement, such as: “EVACUATE, EVACUATE”, and presses the EVAC COMMAND pb.

Ident.: PRO-ABN-90-A-00010419.0002001 / 16 JAN 18
Applicable to: MSN 02359, 02405, 02482

COCKPIT CREW PROCEDURES

The cockpit crew notifies the cabin crew of the nature of the emergency, and states intentions.
The cockpit crew uses the Passenger Address system, to make an appropriate announcement, such as: “EVACUATE, EVACUATE”.

Ident.: PRO-ABN-90-A-00010420.0001001 / 26 JAN 18
Applicable to: ALL

CABIN CREW PROCEDURES

When the cabin receives the order to evacuate, each cabin crewmember must proceed as follows:

STAND UP AND SHOUT.....“UNFASTEN SEATBELTS”
OUTSIDE CONDITIONS.....CHECK

■ **If outside conditions are safe:**
DOOR IN ARMED POSITION.....OPEN FIRMLY
SHOUT.....“COME THIS WAY”

● **If the door does not open automatically:**
DOOR.....PUSH AND OPEN MANUALLY

SLIDE (or SLIDERAFT) DEPLOYMENT.....CHECK FULL DEPLOYMENT
It takes approximately 4 s for the slide (or slideraft) to deploy.

● **If the slide (or slideraft) does not automatically inflate:**
RED, MANUAL INFLATION HANDLE.....PULL
The red, manual inflation handle is located on the right-hand side of the slide (or slideraft) girt extension.

ORDER.....“EVACUATE, EVACUATE”
PASSENGER EVACUATION .....EXPEDITE

● **If the slide (or slideraft) becomes unserviceable:**
PASSENGER EVACUATION.....STOP
PASSENGERS TO ANOTHER USABLE EXIT.....REDIRECT

TOTAL ZONE EVACUATION.....CHECK
CABIN CREW.....EVACUATE
PASSENGERS AWAY FROM THE AIRCRAFT.....DIRECT

■ **If outside conditions are unsafe:**
EXIT DOOR.....BLOCK
PASSENGERS TO NEAREST USABLE EXIT.....REDIRECT

COCKPIT EVACUATION THROUGH WINDOW

Applicable to: ALL

Ident.: PRO-ABN-90-B-00010421.0001001 / 05 AUG 10

OPENING THE SLIDING WINDOW

HANDLE.....PUSH DOWN AND PULL BACK

Pulling the handle backwards, opens the sliding window.

Ident.: PRO-ABN-90-B-00010422.0001001 / 24 NOV 15

COCKPIT EVACUATION WITH ESCAPE ROPE

ESCAPE ROPE STOWAGE.....OPEN

The escape rope stowage is located above the sliding window, on either side of the overhead panel.

ESCAPE ROPE.....UNROLL

Unroll the escape rope, and throw it through the window.

SEAT.....STEP ON

ESCAPE ROPE.....GRASP

Grasp the escape rope firmly with both hands, and slide down along the rope.

EVACUATION ON WATER

Ident.: PRO-ABN-90-C-00010423.0001001 / 05 AUG 10

4 **Applicable to: MSN 01767-01920, 02108, 02359-02405, 02482-02626, 02737, 02908-02914, 03138, 03308, 03357-04312, 04328-04384, 04399-04488, 04506-04518, 04535-04637, 04965, 05080, 05094, 05155-05190, 05230-05727, 05829, 05952, 06720-08440, 08460-08492, 08557, 08587, 08655, 08710-09063**

CABIN CREW RESPONSIBLE FOR TYPE "I" DOORS

When the cabin receives the order to evacuate, each cabin crewmember must proceed as follows:

CHILDREN LIFEVESTS.....DISTRIBUTE

STAND UP AND SHOUT.....“UNFASTEN SEATBELTS – PUT ON YOUR LIFEVEST”

Inflate the lifevest, only once outside the aircraft.

ORDER.....“REMOVE SHOES”

- **If the Type I door is usable:**

  DOOR IN ARMED POSITION.....OPEN

  SLIDE.....DEPLOY

  RED, MANUAL INFLATION HANDLE.....PULL

  Do not wait for automatic inflation of the slide.

■ **If the water level is close to the door sill:**

The slide inflates on the water.

SLIDE.....LEAVE ATTACHED TO CABIN FLOOR
PASSENGER LIFEVESTS.....INFLATE WHEN EVACUATING AIRCRAFT
PASSENGERS.....EVACUATE

Evacuate passengers into the water. The slide is used as a flotation device.

TOTAL ZONE EVACUATION.....CHECK
LAST CREWMEMBER.....EVACUATE
SLIDE.....SEPARATE FROM DOOR SILL

The last crewmember must separate the slide from the door sill.

MOORING LINE.....CUT

■ **If the water level is too far away from the door sill:**

SLIDE.....DISCONNECT FROM DOOR SILL

The slide remains tied to the aircraft by a 6 m (20 ft) mooring line.

MOORING LINE.....HOLD

To keep the slide close to the exit, hold the mooring line.

PASSENGER LIFEVESTS.....INFLATE WHEN EVACUATING AIRCRAFT
PASSENGERS.....EVACUATE

Evacuate passengers into the water. The slide is used as a flotation device.

TOTAL ZONE EVACUATION.....CHECK
LAST CREWMEMBER.....EVACUATE
MOORING LINE.....CUT

CABIN CREW RESPONSIBLE FOR TYPE "I" DOORS

When the cabin receives the order to evacuate, each cabin crewmember must proceed as follows:

CHILDREN LIFEVESTS.....DISTRIBUTE
STAND UP AND SHOUT....."UNFASTEN SEATBELTS – PUT ON YOUR LIFEVEST"

Inflate the lifevest, only once outside the aircraft.

ORDER....."REMOVE SHOES"

● **If the Type I door is usable:**

DOOR IN ARMED POSITION.....OPEN
SLIDERAFT.....DEPLOY

RED, MANUAL INFLATION HANDLE..... PULL

Do not wait for automatic inflation of the slideraft.

■ **If the water level is close to the door sill:**

The slideraft inflates on the water.

SLIDERAFT.....LEAVE ATTACHED TO CABIN FLOOR
PASSENGER LIFEVESTS.....INFLATE WHEN BOARDING SLIDERAFT
PASSENGERS..... BOARD SLIDERAFT
TOTAL ZONE EVACUATION.....CHECK
LAST CREWMEMBER.....BOARD SLIDERAFT
SLIDERAFT..... SEPARATE FROM DOOR SILL

The last crewmember must separate the slideraft from the door sill, and board with all the necessary safety equipment.

MOORING LINE.....CUT
SURVIVAL KIT..... RETRIEVE

The survival kit is attached to the slideraft via a lanyard.

■ **If the water level is too far away from the door sill:**

SLIDERAFT.....DISCONNECT FROM DOOR SILL

The slideraft remains tied to the aircraft by a 6 m (20 ft) mooring line.

MOORING LINE..... HOLD

To keep the slideraft close to the exit, hold the mooring line.

PASSENGER LIFEVESTS.....INFLATE WHEN BOARDING SLIDERAFT
PASSENGERS..... BOARD SLIDERAFT
TOTAL ZONE EVACUATION.....CHECK
LAST CREWMEMBER.....BOARD SLIDERAFT

The last crewmember must board with all the necessary safety equipment.

MOORING LINE.....CUT
SURVIVAL KIT..... RETRIEVE

The survival kit is attached to the slideraft via a lanyard.

Note: *Evacuation is usually done through the passenger doors. However, if one of the passenger doors is not usable, the overwing exit may be used for evacuation. The cabin crew should install the lifeline to help passenger to stay on the wing. These passengers will, however, be obliged to wait on the wing until the slideraft arrives, and until all other passengers have evacuated from the passenger door exits, and have finished boarding the sliderafts.*

FOREWORD

Ident.: PRO-NOR-SOP-01-00010142.0001001 / 05 DEC 17
Applicable to: ALL

The procedures contained in this Chapter are recommended by Airbus, and are consistent with the other Chapters of this manual.

The Authorities do not certificate Standard Operating Procedures. The manufacturer presents them herein as the best way to proceed, from a technical and operational standpoint. They are continually updated and the revisions take into account Operator input, as well as manufacturer experience.

In addition, Operators may amend them, as needed. However, the manufacturer recommends that Operators using the FCOM as onboard operational manual submit suggested changes to expedite publication, and maintain consistency of the manual. The Operator should note that they may rewrite this Chapter, at their own responsibility; this could, however, make it difficult to update the manual and keep it consistent with the other Chapters.

The following sections contain expanded information on normal procedures.

Standard Operating Procedures consist of inspections, preparations, and normal procedures. All items of a given procedure are listed in a sequence that follows a standardized scan of the cockpit panels, unless that sequence goes against the action priority logic, to ensure that all actions are performed in the most efficient way.

These procedures assume that all systems are operating normally, and that all automatic functions are used normally.

Standard Operating Procedures consider that both pilots use Electronic Flight Bag (EFB). Airbus recommends operating with two EFBs in order to reduce the risk of erroneous inputs.

The FCOM also contains normal procedures that are non-routine procedures in the Supplementary Procedures chapter and in the Special Operations chapter.

Intentionally left blank

TECHNICAL CONDITION OF THE AIRCRAFT

Ident.: PRO-NOR-SOP-02-00010147.0001001 / 05 AUG 10
Applicable to: ALL

The crew will verify the technical state of the aircraft (deferred defect list), with regard to airworthiness, acceptability of malfunctions (MEL), and influence on the flight plan.

WEATHER BRIEFING

Ident.: PRO-NOR-SOP-02-00010148.0001001 / 05 AUG 10
Applicable to: ALL

- The crew will get a weather briefing
- The briefing should include:
  - Actual and expected weather conditions, including runway conditions for takeoff and climb-out
  - Significant weather enroute, including winds and temperatures
  - Terminal forecasts for destination and alternate airports
  - Actual weather for destination and alternates, for short range flights and recent past weather, if available
  - Survey of the meteorological conditions at airports along the planned route.

Weather can affect the choice of routing (for example, influence which route is quickest) and the choice of flight level. The flight crew must also consider the possibility of runways being contaminated at the departure and destination airfields. The flight crew must also verify ISA deviations and enroute icing conditions, and must consider the possibility of holding due to weather at the destination.

NOTAMS

Ident.: PRO-NOR-SOP-02-00010149.0002001 / 29 MAY 13
Applicable to: ALL

- The flight crew must examine NOTAMs for changes to routings, unserviceable navaids, availability of runways and approach aids etc, all of which may affect the final fuel requirement
- In order to prevent the risks of projection of debris towards the trimmable horizontal stabilizer and the elevators, it is not recommended to takeoff from runways in bad condition (loose surface, under repair, covered with debris...)

GPS PRIMARY AVAILABILITY (IF INSTALLED)

Ident.: PRO-NOR-SOP-02-00014998.0001001 / 20 MAR 17
Applicable to: MSN 02584, 02737

- **For RNP1 operations, RNAV(GNSS) approaches and RNAV(RNP) ⩤ approaches:**
  If required by operational regulation, an appropriate Ground-Based Prediction Program should be used to check the RAIM/AIME for each intended procedure (arrival, departure, alternate if required).

GPS PRIMARY AVAILABILITY (IF INSTALLED)

Ident.: PRO-NOR-SOP-02-00014998.0002001 / 20 MAR 17
1 **Applicable to: MSN 01767-02482, 02609-02712, 02804-09063**

- **For RNP1 operations, RNAV(GNSS) approaches and RNAV(RNP) ⩤ approaches:**
  RAIM/AIME has been demonstrated to be available 100% of the time with 24 healthy satellites.If required by operational regulation, for specific conditions (e.g RNAV(RNP), mountainous terrain or less than 24 satellites) an appropriate Ground-Based Prediction Program should be used to check the RAIM/AIME for each intended procedure (arrival, departure and alternate if required)

FLIGHT PLAN AND OPERATIONAL REQUIREMENTS

Ident.: PRO-NOR-SOP-02-00010150.0001001 / 18 MAR 11
Applicable to: ALL

- The crew will check the company flight plan for routing, altitudes, and flight time
- The Captain will check the ATC flight plan and ensure that:
  - It is filled in and filed, in accordance with the prescribed procedures
  - It agrees with the fuel flight plan routing.
- The crew will check the estimated load figures, and will calculate the maximum allowable takeoff and landing weights.

OPTIMUM FLIGHT LEVEL

Ident.: PRO-NOR-SOP-02-00010151.0001001 / 22 MAR 17
Applicable to: ALL

The flight crew should choose a flight level that is as close to the optimum as possible. To determine the optimum flight level, *Refer to QRH/PER-M Optimum & Maximum Altitudes (Paper Only)* or use the performance application of FlySmart with Airbus.
As a general rule, an altitude that is 4 000 ft below the optimum produces a significant penalty (approximately 5 % of fuel). Flight 8 000 ft below the optimum altitude produces a penalty of more than 10 % against trip fuel. (The usual contingency allowance is 5 %).

FUEL REQUIREMENTS

Ident.: PRO-NOR-SOP-02-00010152.0001001 / 05 AUG 10
Applicable to: ALL

COMPUTERIZED FLIGHT PLAN CHECK

In most cases the flight crew uses a computer-derived flight plan to obtain the correct fuel requirements. Although these computerized requirements are normally accurate, the flight crew must check them for gross errors.

The easiest way to do this is to use the "Quick Determination of F-PLN" tables (*Refer to PER-FPL-FLP-QFP-40 FLIGHT PLANNING M.78*). Although the aircraft will fly at ECON MACH that is based on the cost index, the M 0.78 table is accurate enough to permit the crew to check for gross error.

Ensure that both the captain and the first officer have verified that the fuel calculations and required fuel on board are correct and that the figure complies with the applicable regulations.

FUEL TRANSPORTATION

The flight crew must check the policy covering the "tankering" of fuel on sectors where there is a favourable fuel price differential or operational requirement.

Remember that carrying unnecessary extra fuel increases the fuel consumption for that sector and therefore reduces the economy of the operation (lower flex temperature, more tire and brake wear, more time in climb phase, lower optimum flight level etc).

Intentionally left blank

SAFETY EXTERIOR INSPECTION

Applicable to: ALL

Ident.: PRO-NOR-SOP-03-A-00010153.0001001 / 05 DEC 17

Items marked by asterisks (*) are the only steps to be completed after a transit stop without flight crew change. Otherwise, the new flight crew performs all the items.
This inspection ensures that the aircraft and its surroundings are safe for operations.
On arriving at the aircraft, check for obstructions in the vicinity, engineering activity, refueling, etc.

Ident.: PRO-NOR-SOP-03-A-00010154.0001001 / 04 MAR 14

* WHEEL CHOCKS..... CHECK

If the wheel chocks are not in position, the flight crew must check that the parking brake is set with sufficient accumulator pressure.

Ident.: PRO-NOR-SOP-03-A-00010155.0001001 / 18 MAR 11

* LANDING GEAR DOORS.....CHECK POSITION

WARNING	*Do not pressurize the green hydraulic system without clearance from ground personnel, if any gear door is open. Remember that the green hydraulic system is pressurized if the yellow system is pressurized and the PTU is on AUTO.*

Ident.: PRO-NOR-SOP-03-A-00010156.0001001 / 05 AUG 10

* APU AREA..... CHECK

Observe that the APU inlet and outlet are clear.

Intentionally left blank

GENERAL

Ident.: PRO-NOR-SOP-04-00010164.0001001 / 05 JUN 18
Applicable to: ALL

Items marked by asterisks (*) are the only steps to be completed after a transit stop without flight crew change. Otherwise, the new flight crew performs all the items.
The following procedure, ensures that all the required checks are performed before applying electrical power to avoid inadvertent operation of systems and danger to the aircraft and personnel. The APU start and the establishment of electrical and pneumatic power are included.

AIRCRAFT SETUP

Ident.: PRO-NOR-SOP-04-A-00021906.0001001 / 30 AUG 17
Applicable to: ALL

WARNING	Do not pressurize the hydraulic systems until clearance is obtained from ground personnel.

BATTERY CHECK/SETUP

Ident.: PRO-NOR-SOP-04-00010168.0001001 / 30 AUG 17
Applicable to: ALL

■ **If the aircraft has not been electrically supplied for 6 h or more, perform the following check:**

BAT 1 pb and BAT 2 pb..... CHECK OFF
BAT 1 and 2 VOLTAGE..... CHECK ABOVE 25.5 V

Battery voltage above 25.5 V ensures a charge above 50 %.

■ **If the battery voltage is at or below 25.5 V:**

A charging cycle of about 20 min is required.

BAT 1 pb and BAT 2 pb.....AUTO
EXT PWR pb-sw..... ON

Check on ELEC SD page, that the battery contactor is closed and the batteries are charging.

● **After 20 min:**

BAT 1 + 2 pb..... OFF
BAT 1 and 2 VOLTAGE..... CHECK ABOVE 25.5 V
BAT 1 + 2 pb..... AUTO

■ **If the battery voltage is above 25.5 V:**

BAT 1 pb and BAT 2 pb.....AUTO

If the APU is started on batteries only, it should be started within 30 min after the selection of batteries to AUTO (35 min after battery selection to AUTO, the battery charge is less than 25 % of maximum capacity).

■ **If the aircraft has been electrically supplied during the last 6 h:**

BAT 1 pb and BAT 2 pb..... AUTO

● **If the AVAIL light is on:**
EXT PWR pb-sw.....ON

APU FIRE TEST/APU START

APU FIRE

APU FIRE pb-sw.....CHECK IN and GUARDED
AGENT lights .....CHECK OFF
APU FIRE TEST pb.....PRESS and MAINTAIN

TEST RESULT

Check that the APU fire detection and extinguishing system is operative:

- APU FIRE warning on:
  - ECAM
  - CRC
  - MASTER WARN light (if AC Power available).
- APU FIRE pb-sw lighted red.
- SQUIB light and DISCH light on

Ident.: PRO-NOR-SOP-04-B-00010171.0015001 / 17 MAR 17

APU START

■ **If the EXT PWR pb-sw ON light is on:**
APU MASTER SW pb-sw.....ON
APU START pb-sw.....ON

Note: Wait at least 3 s before selecting APU START pb-sw.

For more information on the APU start, Refer to DSC-49-20 Overhead Panel - Illustration.

For more information on APU starter limitations and APU operations during refueling:
- *Refer to LIM-APU APU Start*
- *Refer to LIM-APU APU Start/Shutdown during Refueling/Defueling.*

EXT PWR pb-sw.....AS RQRD

The flight crew should keep ON the external power units to reduce the APU load, particularly in hot weather conditions.

■ **If the EXT PWR pb-sw ON light is off:**
APU MASTER SW pb-sw.....ON

APU START pb-sw..... ON

Note: Wait at least 3 s before selecting APU START pb-sw.

For more information on the APU start, Refer to DSC-49-20 Overhead Panel - Illustration.

For more information on APU starter limitations and APU operations during refueling:
- *Refer to LIM-APU APU Start*
- *Refer to LIM-APU APU Start/Shutdown during Refueling/Defueling.*

AIR COND

Ident.: PRO-NOR-SOP-04-00010177.0001001 / 14 OCT 15
Applicable to: ALL

AIR COND

● **When the APU is AVAIL:**

APU BLEED pb-sw..... ON

Do not use APU BLEED, if the ground personnel confirms that a LP or HP ground air unit is connected to the aircraft.
To determine if an HP ground air unit is connected, the flight crew should also check on the BLEED SD page, if there is pressure in the bleed air system.

ALL WHITE LIGHTS..... OFF

EFB/ACARS (IF INSTALLED) INITIALIZATION

Ident.: PRO-NOR-SOP-04-C-00021913.0001001 / 05 DEC 17
Applicable to: ALL

EFB START

ALL EFB.....START

- **In accordance with the Operator's policy or if required by operational regulation:**
  EFB/eQRH VERSION.....CHECK

  If required, the flight crew performs this check unless a specific procedure is established as per Operator's policy to ensure that the correct version is onboard.
  On the EFB STATUS page and the eQRH My aircraft page, check the EFB VERSION number and compare it with the valid version number given as reference by the Operator (e.g. on the company flight plan).

Ident.: PRO-NOR-SOP-04-C-00021947.0001001 / 04 DEC 18
Applicable to: ALL

ACARS INITIALIZATION

* ACARS ◁ .....INITIALIZE

Initialize ACARS if not done automatically, as per company policy.

Ident.: PRO-NOR-SOP-04-C-00014422.0001001 / 04 DEC 18
Applicable to: ALL

FMGS PRE-INITIALIZATION

Perform FMGS Pre-Initialization in the case of ACARS ◁ operations or EFB operations with SYNCHRO AVIONICS ◁ .
At electrical power-up, the FMGSs and FCU run through various internal tests. Allow enough time (3 min) for tests' completion, and do not start to press pushbuttons until the tests are over. If the "PLEASE WAIT" message appears, do not press any MCDU key until the message clears.

Ident.: PRO-NOR-SOP-04-C-00014423.0001001 / 05 DEC 17
Applicable to: ALL

Applicable to: ALL

EFB FLT OPS STATUS PAGE

* EFB SYNCHRO AVIONICS ..... CLICK
* EFB FLT OPS STS page.....INSERT/CHECK

L2 On the FLT OPS STS page, each flight crewmember checks or, inserts and checks (if no EFB SYNCHRO AVIONICS):
- ACFT TYPE and ACFT REG
- FLT NBR and FROM/TO (in agreement with the FMS ACTIVE/INIT page).

ECAM/LOGBOOK CHECK

Ident.: PRO-NOR-SOP-04-00021915.0001001 / 05 DEC 17
Applicable to: ALL

* RCL pb .....PRESS 3 s

This action recalls all the warnings that the flight crew cleared or cancelled during the last flight

* LOGBOOK .....CHECK

- *In the logbook check the technical condition of the aircraft (deferred defect list) with regard to airworthiness, acceptability of the MEL, or the Configuration Deviation List (CDL), and influence on the flight plan.*
- *Crosscheck with ECAM recall.*

* MEL/CDL ITEMS (as appropriate)..... CHECK DISPATCH CONDITIONS

Access the MEL and CDL items via the Ops Library Browser.
As appropriate, check and activate MEL and CDL items. The activated MEL and CDL items are sent to the performance applications.

* AIRCRAFT ACCEPTANCE.....PERFORM

PRELIMINARY PERFORMANCE DETERMINATION

Ident.: PRO-NOR-SOP-04-00021916.0001001 / 05 DEC 17
Applicable to: ALL

For more information, *Refer to FCTM/PR-NP-SOP-PRELIMINARY COCKPIT PREPARATION-Preliminary Takeoff Performance Computation*

Each flight crewmember independently computes the preliminary performance data in accordance with the technical condition of the aircraft and/or any other criteria that may impact the aircraft performance (e.g. NOTAM, runway condition, aircraft configuration).

* AIRFIELD DATA.....OBTAIN

Obtain data needed for initializing the system, preparing the cockpit and for preliminary takeoff performance computation. The airfield data should include: RUNWAY IN USE, ALTIMETER SETTING, and WEATHER DATA.

- **If the LOADSHEET application is used :**
  * PRELIMINARY LOADING.....COMPUTE AND CROSSCHECK
- **If dispatch under MEL and in accordance with the logbook:**
  * MEL/CDL ITEMS (as appropriate)..... CHECK ACTIVATED

  As appropriate, check that the MEL and CDL items are activated in the applicable T.O PERF application.

* PRELIMINARY TAKEOFF PERF DATA.....COMPUTE

The PF and the PM independently compute the preliminary takeoff performance data.

* PRELIMINARY TAKEOFF PERF DATA..... CROSSCHECK

The PF and the PM compare and ensure that the computations are the same.

OPERATION ENGINEERING BULLETINS (OEB)

Ident.: PRO-NOR-SOP-04-00021914.0001001 / 05 DEC 17
Applicable to: ALL

* OEB..... CHECK

Go to the OEB section of the QRH and review all OEBs (particularly red OEBs) that are applicable to the aircraft.

Note: *If there is a transfer of duties during this flight, the flight crew must remind the incoming flight crew of the applicable OEB(s) during the briefing that is done when transferring the duties.*

Applicable to: ALL

F/CTL

FLAPS.....CHECK POSITION

Check the upper ECAM display to confirm that the FLAPS position agrees with the handle position.

* SPEEDBRAKE lever.....CHECK RETRACTED and DISARMED

WARNING	*If flight control surface positions do not agree with the control handle positions, check with the maintenance crew before applying hydraulic power.*

Ident.: PRO-NOR-SOP-04-E-00010174.0001001 / 05 DEC 17
Applicable to: ALL

PARKING BRAKE

* ACCU PRESS indicator..... CHECK

The ACCU PRESS indication must be in the green band. If required use the electric pump on yellow hydraulic system to recharge the brake accumulator.

* PARKING BRAKE handle..... ON

When one brake temperature is above 500 °C, avoid applying the parking brake, unless operationally necessary.

* BRAKES PRESS indicator..... CHECK

Check for normal indications.

WARNING	Yellow and green hydraulic systems are pressurized from yellow electric pump. Get ground crew clearance before using the electric pump.

Ident.: PRO-NOR-SOP-04-E-00010175.0001001 / 30 JUN 15
Applicable to: MSN 01767-02405, 02482

ALTERNATE BRAKING SYSTEM

Note: *The purpose of this check is to verify, before the first flight of the day, the efficiency of the alternate braking system (absence of "spongy pedals").*

Y ELEC PUMP pb-sw.....CHECK OFF
CHOCKS..... CHECK IN PLACE
PARK BRK handle.....OFF
BRAKE PEDALS.....PRESS

Apply maximum pressure on both pedals.

BRAKE PRESSURE (on BRAKE press indicator).....CHECK

Pressure must build up without delay symmetrically on left and right sides for the same application simultaneously applied on left and right pedals. With full pedal deflection, the pressure must be between 2 000 and 2 700 PSI.

BRAKE PEDALS..... RELEASE
PARK BRK handle..... ON

The parking brake must be on during the exterior inspection to allow the flight crew to check brake wear indicators.

Ident.: PRO-NOR-SOP-04-E-00010206.0001001 / 23 JUN 15
Applicable to: ALL

EMERGENCY EQUIPMENT

EMER EQPT..... CHECK

Check the emergency equipments as follows:
- *Life jackets stowed*
- *Axe stowed*
- *Smoke hoods ◁ or portable oxygen equipment and full face masks ◁ stowed and serviceable*
- *Portable fire extinguisher lockwired and pressure in the green area*
- *Smoke goggles stowed (smoke hoods ◁)*
- *Oxygen masks stowed*
- *Flashlights stowed*
- *Escape ropes stowed*

Applicable to: ALL

REAR AND OVERHEAD CIRCUIT BREAKERS PANELS

REAR and OVERHEAD CIRCUIT BREAKERS panels..... CHECK

Check that all circuit breakers are set. Reset as necessary.

Ident.: PRO-NOR-SOP-04-E-00010209.0001001 / 25 JAN 17
Applicable to: ALL

LANDING GEAR PINS AND COVERS

* GEAR PINS and COVERS..... CHECK ONBOARD and STOWED

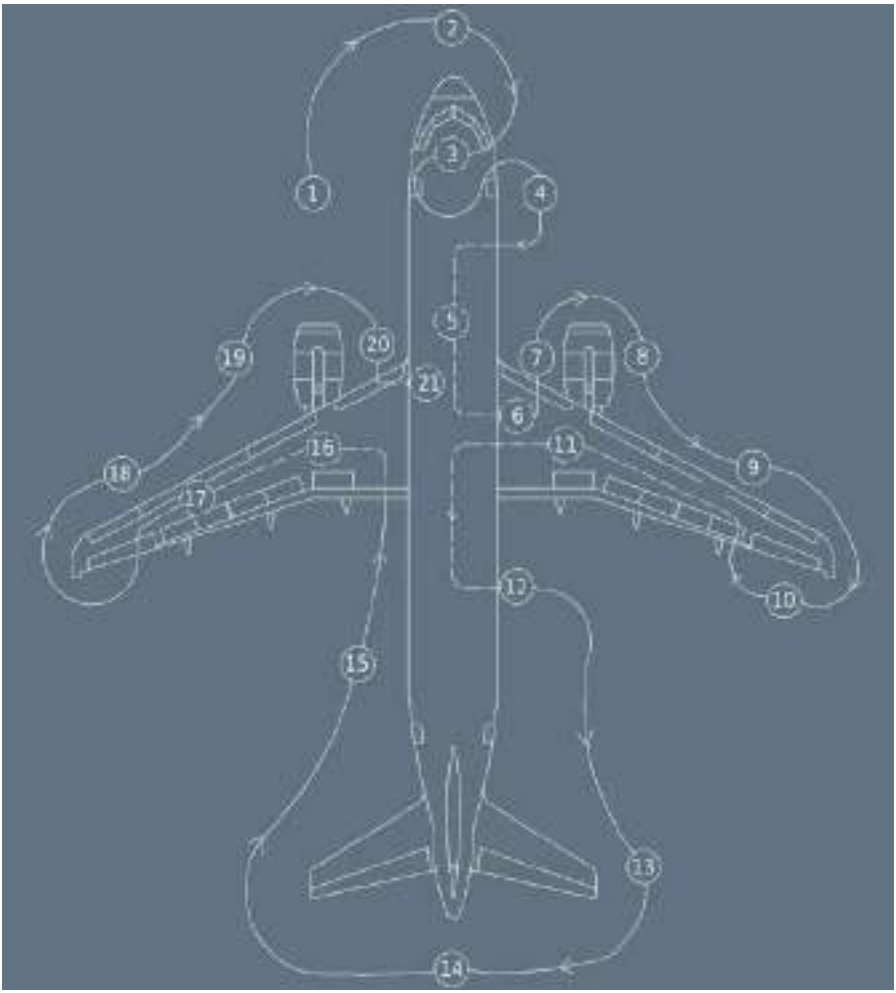
Check that three are on board and stowed.

GENERAL

Ident.: PRO-NOR-SOP-05-00010360.0001001 / 17 MAY 17
Applicable to: ALL

The exterior walkaround ensures that the general condition of the aircraft is satisfactory and that the visible aircraft components and equipment are safe for the flight:

- There is no impact damage to the structure
- There is no evident fuel, oil, or hydraulic leak
- All ground access doors are closed.



The flight crew must perform a complete walkaround before each flight.
The parking brake must be set to ON during the exterior walkaround, in order to enable the flight crew to check brake wear indicators.

WARNING	If any landing gear door is open, do not apply hydraulic power until clearance is obtained from ground personnel.

EXTERIOR WALKAROUND

Ident.: PRO-NOR-SOP-05-A-00010361.0001001 / 04 MAY 15

GENERAL

Ident.: PRO-NOR-SOP-06-00011153.0001001 / 05 DEC 17
Applicable to: ALL

Items marked by asterisks (*) are the only steps to be completed after a transit stop without flight crew change. Otherwise, the new flight crew performs all the items.
The PF and PM should perform the cockpit preparation according to the panel scan sequence defined below (*Refer to PRO-NOR-SOP-06 Flow Pattern*), and the task sharing defined in the QRH (*Refer to QRH/Normal Procedures - Cockpit Preparation*).

OVERHEAD PANEL

Ident.: PRO-NOR-SOP-06-A-00011155.0001001 / 31 JUL 13
Applicable to: ALL

WHITE LIGHTS ON THE OVERHEAD PANEL

- **During the scan sequence of the overhead panel:**
  * ALL WHITE LIGHTS..... EXTINGUISH

  It is a general rule to turn off all the white lights during the scan sequence; therefore, these actions are not listed here.

Ident.: PRO-NOR-SOP-06-A-00015476.0001001 / 05 DEC 17
1 **Applicable to: MSN 06720-09045**
Impacted by TDU: 00021691 Overhead Panel - RCDR

RCDR

* RCDR GND CTL pb-sw..... ON

In order to perform the test, ensure that the PARK BRK is on.

LOUDSPEAKER VOLUME knob..... OFF (BOTH SIDES)
ACP INT/RAD sw (CAPT and F/O)..... SET to INT
INTERPHONE VOLUME RECEPTION KNOB (CAPT and F/O)..... RELEASE

Turn down the volume to the minimum.

CVR TEST pb..... PRESS AND MAINTAIN

The CVR test is successful when an audio test signal is heard through the loudspeakers and the CVR TEST pb is pressed and maintained.
Depending on the CVR model, the audio test signal is:

- For CVR 30 minutes:

- A continuous tone, or
- A short tone.

- For CVR 120 minutes:

- A short tone, or
- A short tone and a beep every 4 s, or
- Two short tones and a beep every 4 s.

The audio test signal stops when the CVR TEST pb is released.

Note: - The flight crew may also hear an acoustic feedback (i.e. Larsen effect) during the test. The test is still valid even if this acoustic feedback (i.e. Larsen effect) is heard.
- If the flight crew cannot hear the audio test signal through the loudspeakers, and if the CVR maintenance headset (22RK headset) is available, the flight crew can perform the CVR TEST through the CVR maintenance headset.
- If an acoustic feedback (i.e. Larsen effect) is still heard, the flight crew can perform the CVR TEST using the 22RK headset and with the parking brake set to off. Before setting the parking brake to off, the flight crew must ensure that chocks are in place or brakes are applied. Set the parking brake to on when the CVR TEST is achieved.
- If no 22RK headset is available, the Larsen effect can also be reduced by preventing the cockpit ambient microphone from picking up the ambient sound (i.e. by temporarily covering it during the test).

Note:
- *The flight crew may also hear an acoustic feedback (i.e. Larsen effect) during the test. The test is still valid even if this acoustic feedback (i.e. Larsen effect) is heard.*
- *If the flight crew cannot hear the audio test signal through the loudspeakers, and if the CVR maintenance headset (22RK headset) is available, the flight crew can perform the CVR TEST through the CVR maintenance headset.*
- *If an acoustic feedback (i.e. Larsen effect) is still heard, the flight crew can perform the CVR TEST using the 22RK headset and with the parking brake set to off. Before setting the parking brake to off, the flight crew must ensure that chocks are in place or brakes are applied. Set the parking brake to on when the CVR TEST is achieved.*
- *If no 22RK headset is available, the Larsen effect can also be reduced by preventing the cockpit ambient microphone from picking up the ambient sound (i.e. by temporarily covering it during the test).*

5 Ident.: TDU / PRO-NOR-SOP-06-A-00021691.0003001 / 17 JAN 18
Applicable to: MSN 09063
Impacted DU: 00015476 Overhead Panel - RCDR

RCDR

* RCDR GND CTL pb-sw..... ON

Note: *Before engine start, the RCDR GND CTL pb-sw may revert to AUTO in the case of electrical transient between EXT PWR and APU GEN. In that case, the flight crew must set the RCDR GND CTL pb-sw back to ON.*

In order to perform the test, ensure that the PARK BRK is on.

LOUDSPEAKER VOLUME knob..... OFF (BOTH SIDES)
ACP INT/RAD sw (CAPT and F/O).....SET to INT
INTERPHONE VOLUME RECEPTION KNOB (CAPT and F/O)..... RELEASE

Turn down the volume to the minimum.

CVR TEST pb.....PRESS AND MAINTAIN

The CVR test is successful when an audio test signal is heard through the loudspeakers and the CVR TEST pb is pressed and maintained.
Depending on the CVR model, the audio test signal is:

- *For CVR 30 minutes:*
  - *A continuous tone, or*
  - *A short tone.*
- *For CVR 120 minutes:*
  - *A short tone, or*
  - *A short tone and a beep every 4 s, or*
  - *Two short tones and a beep every 4 s.*

The audio test signal stops when the CVR TEST pb is released.

ADIRS

* All IR MODE selector..... NAV

Align or realign IRS as appropriate. *Refer to FCTM/PR-NP-SOP-60 ADIRS Operations.*

Note: *In order to prevent an erroneous data initialization, wait at least 12 min after power-up and then select the ADIRS to NAV.*

L2 A complete IRS alignment must be performed in the following cases:
- Before the first flight of the day, or
- When there is a crew change, or
- When the GPS is not available and the NAVAIDS coverage is poor on the expected route, or
- When the GPS is not available and the expected flight time is more than 3 h.

A fast IRS alignment must be performed if a complete IRS alignment is not necessary and the difference between the IRS position and the FMGC position is at or above 5 NM (see MCDU POSITION MONITOR page).
To perform an alignment, the aircraft must be stopped on ground. Any aircraft movement will automatically restart the IRS alignment.
Do not align IRS during engine start, or while the engines are running.

Applicable to: ALL

* F-PLN A page.....COMPLETE AND CHECK

If CO RTE has been inserted, the F-PLN should automatically include the preferential or probable takeoff runway approach and landing runway, associated SIDs, STARs, transition and en-route waypoints. However some databases will only include departure and arrival airport IDENTs and en-route waypoints.

The flight crew must check, modify, or insert (as applicable) the F-PLN in the following order, according to the data given by ATIS, ATC, or MET:

- *Lateral revision at departure airport. Select RWY, then SID, then TRANS using scroll keys.*

  Note: On the MCDU departure page, select only a runway associated with an ILS or NO NAVAIDS.

- *Lateral revision at WPT for ROUTE modification if needed. (Refer to DSC-22_20-30-10-05 Lateral Revisions).*
- *Vertical revision. Check or enter climb speed limit, constraints according to ATC clearance. Enter step altitude as appropriate.*

* WINDS.....AS APPROPRIATE

Choose between using trip wind and the forecast wind for CLB, CRZ and DES phases.(Refer to DSC-22_20-30-20-05 Flight Phases).

* F-PLN.....CHECK

- *Check the F-PLN using F-PLN page and ND PLAN mode versus the computer (paper) flight plan or navigation chart.*
- *Check DIST TO DEST along the F-PLN. Compare it with the total distance computed for the flight with the computer (paper) flight plan.*

Ident.: PRO-NOR-SOP-06-D-00011234.0001001 / 18 MAR 11
Applicable to: ALL

* SECONDARY FLIGHT PLAN..... AS APPROPRIATE

This is routinely a copy of the active flight plan. However, consideration may be given to the following:

a. *Copy the active F-PLN, but modify it at a suitable WPT for an immediate return to the departure airfield in the event of, for example, engine failure*
b. *If weather is below landings minima at the departure airfield, the secondary flight plan should be that required for a diversion immediately after takeoff*
c. *If there is a chance of a change in runway or SID during taxi, prepare for it by copying the active flight plan and making the necessary modifications.*

GROSS WEIGHT INSERTION (INIT B PAGE):

* ZFWCG/ZFW..... INSERT
* BLOCK FUEL.....INSERT

CAUTION	The characteristic speeds displayed on the MCDU (green dot, F, S, VLS) are computed from the ZFW and ZFWCG entered by the crew on the MCDU. Therefore, this data must be carefully checked (Captain's responsibility).

- The flight crew should insert the weights after completing all other insertions. This is to avoid cycles of prediction computations at each change in flight plan, constraints, etc.
- If ZFWCG and ZFW are unavailable, it is acceptable to enter the expected values in order to obtain predictions. Similarly, the flight crew may enter the expected fuel on board, if refueling has not been completed at that time.
- If ZFWCG, ZFW, and BLOCK FUEL are inserted, the FMS will provide all predictions, as well as the EXTRA fuel, if any.

TAKEOFF DATA INSERTION (PERF TAKEOFF PAGE):

The PF inserts the takeoff data in the PERF TAKEOFF page of the MCDU.

* T.O SHIFT.....INSERT AS RQRD

If the aircraft takes off from an intersection, insert a T.O shift value (even when GPS PRIMARY is active) to increase flight crew awareness of the runway length reduction.

* V1, VR, V2.....INSERT
* FLX TO TEMP.....INSERT
* THR RED/ACC altitude..... SET or CHECK
* ENG OUT ACC altitude.....SET or CHECK
* FLAPS/THS reminder..... INSERT

When entered in the MCDU, the THS value will be used to trigger the F/CTL PITCH TRIM/MCDU/CG DISAGREE ECAM caution, if appropriate.

Ident.: PRO-NOR-SOP-06-D-00011243.0001001 / 13 AUG 10
Applicable to: ALL

CLIMB, CRUISE, DESCENT, SPEED PRESELECTION

* PRESET SPEEDS.....AS RQRD

If the flight is cleared for a close-in turn or close-in altitude constraint, the flight crew may preselect green dot speed on the PERF CLB page. Once the CLB phase is active, the preselected speed will be displayed in the FCU speed window and on the PFD (blue symbol). Once the turn is completed or the altitude cleared, the pilot will resume the managed speed profile by pressing the SPD selector on the FCU.
Similarly the pilot may select a CRZ MACH number on the PERF CRZ page (constant CRZ Mach segment, for example). When the CRZ phase is active, the preselected CRZ MACH number will be displayed in the FCU speed window and on the PFD. When ECON MACH number may be resumed, the crew presses the FCU SPD selector.
In either of the above cases, the pilot may cancel the CLB or CRZ preselected SPD/MACH prior to activating the related phase, by selecting ECON on the PERF CLB or CRZ pages.

SPD LIM is defaulted to 250 kt below 10 000 ft in the managed speed profile. This may be either cleared or modified on the VERT REV page at the origin (or a climb waypoint).

OXYGEN MASK TEST

WARNING	To prevent hearing damage to ground mechanics connected to the intercom system, inform them that a loud noise may be heard in the headset when performing this test.

On the OXYGEN panel:

CREW SUPPLY pb..... CHECK ON

On the glareshield:

LOUDSPEAKERS.....ON

On the audio control panel:

INT reception knob..... PRESS OUT-ADJUST
INT/RAD sw.....INT

On the mask stowage box:

- Press and hold the reset/test button in the direction of the arrow.
  - Check that the blinker turns yellow for a short time, and then goes black.
- Hold the reset/test button down, and press the emergency pressure selector.
  - Check that the blinker turns yellow and remains yellow, as long as the emergency pressure selector is pressed.
  - Listen for oxygen flow through the loudspeakers. Warn any engineer, whose headset may be connected to the nose intercom, that a loud noise may be heard when performing this check.
- Check that the reset/test button returns to the up position and the N 100 % selector is in the 100 % position.
- Press the emergency pressure selector again, and check that the blinker does not turn yellow. This ensures that the mask is not supplied.

On the ECAM DOOR/OXY page:

REGUL LO PR message.....CHECK OFF

The crew must perform this check after having checked all masks. It ensures that the LP valve is open, (due to residual pressure between the LP valve and the oxygen masks, an LP valve failed in the closed position may not be detected during the oxygen mask test).

- **If pushback is required:**
  N/W STRG DISC MEMO..... CHECK DISPLAYED

In case of pushback (conventional or towbarless), the nosewheel steering selector bypass pin must be in the tow position. The ECAM's NW STRG DISC, or N WHEEL STEERG DISC memos indicate this to the flight crew.

CAUTION	*If the ECAM does not display the N WHEEL STEERG DISC memo, but the ground crew confirms that the tow pin is in the towing position, the flight crew should not start the engine during pushback. This is to avoid possible nose landing gear damage upon yellow hydraulic pressurization.* *To dispatch the aircraft in such a case, Refer to MMEL/MI-32-51 NWS Electrical Deactivation Box.*

In case of a powerpush by the main landing gear, the nosewheel steering selector should remain in the normal position to steer the aircraft (Refer to PRO-NOR-SUP-MISC-D Pushback with Power Push Unit via the Main Landing Gear - Procedure 1/2).

BEFORE START CHECKLIST below the line..... COMPLETE

PARK BRK handle.....OFF

CAUTION	*Do not use the brakes during pushback, unless required due to an emergency.*

- **When pushback is completed:**

  PARK BRK handle..... ON
  BRAKE PRESS indicator..... CHECK

  Check for normal indications.
  Ask the ground crew for towbar disconnection.

AUTOMATIC ENGINE START

Ident.: TDU / PRO-NOR-SOP-08-00022757.0001001 / 04 DEC 18

[1] **Applicable to: MSN 06772, 06829, 06904, 06946, 07083-07192, 07329-09063**
Impacted DU: 00010162 Automatic Engine Start

Use the automatic engine start procedure in most circumstances. However, if the start aborts due to insufficient starter inlet air pressure (e.g. on high airfields, or in case of low pressure from an external pneumatic power group), it is recommended to use the manual start procedure, instead the automatic procedure.
If, during the engine start, the ground crew reports a leak from the engine, abort the engine start sequence. Maintenance action is due before the flight.

ENG MODE selector..... IGN/START

The lower ECAM displays the ENG SD page. Depending on the engine thermal state, the FADEC can command an automatic dry cranking (engine cooling). In such case, when the ENG MODE selector is set to IGN/START, the indication COOLING is displayed on the E/WD for one, or both engines with the expected engine cooling time indicated. Refer to DSC-70-80-40 Engine Cooling

DUAL COOLING pb-sw..... AS RQRD

If dual cooling is required, wait at least 3 seconds before setting the DUAL COOLING pb-sw to ON after ENG MODE selector is set to IGN/START to allow for the cooling time calculation. Setting the DUAL COOLING pb-sw to ON enables to arm the dual cooling function: When the ENG MASTER lever is set to ON, the FADEC commands an automatic dry cranking on both engines simultaneously (if cooling is required). This enhances the overall time to start the engines when cooling is required. When this function is armed, the memoDUAL COOLING is displayed on the E/WD.

ENGINE 2 START.....ANNOUNCE

Engine 2 is usually started first. It powers the yellow hydraulic system, that pressurizes the parking brake.

ENG MASTER 2.....ON

- *Do not set the ENG MASTER 2 lever to ON before all amber crosses and messages have disappeared on the engine parameters (upper ECAM display).*
- *Parameter callouts are not mandatory.*
- *In case the electrical power supply is interrupted during the start sequence (indicated by the loss of ECAM DUs), abort the start by setting to OFF the ENG MASTER 2 lever. Then, perform a 30 s dry crank.*
- *Depending of the engine thermal state, the FADEC can command an automatic dry cranking (or engine cooling) with the associated COOLING indication displayed on the E/WD.*
  Refer to DSC-70-80-40 Engine Cooling

Note: If the DUAL COOLING function is armed, the cooling will be performed on both engines simultaneously. In such case, the FADEC resumes the start sequence of ENG 2 once the cooling time indication is at zero for both engines.

ON ECAM UPPER DISPLAY	ON ECAM LOWER DISPLAY
N2 increases	*Corresponding start valve inline.* *Bleed pressure indication green.* *Oil pressure increases.*
At approximately 18 % N2: *- FF increases.*	*Indication of the active igniter (A or B).*
20 s (maximum) after fuel is on *- EGT increases* *- N1 increases prior to 48 % N2.*	
At approximately 55 % N2	*Start valve crossline.* *Igniter indication off.*

Note: When the FADEC detects an impending hot start or stall, the FADEC applies an automatic recovery sequence without an ECAM message. The flight crew notices that fuel will be commanded OFF, and then re-commanded ON. It is not necessary for the flight crew to shut down the engine.

- **When idle is reached (AVAIL indication is displayed):**

ENG IDLE PARAMETERS..... CHECK

At ISA sea level : N1 about 19 %
N2 about 59 %
EGT about 550 °C
FF about 270 kg/h (600 lb/h)

ENGINE 1 START..... ANNOUNCE
ENG MASTER 1..... ON

Same procedure as for engine 2.

Note: - If dual cooling has been selected for engine start, the FADEC keeps in memory the cooling benefit for ENG 1 provided ENG 1 is started within 20 min after ENG 2 start. However, in any case, the FADEC commands an engine cooling before ENG 1 start.
- A PTU FAULT is triggered, if the last engine is started within 40 s following the end of the cargo doors operation. .Refer to PRO-ABN-HYD HYD PTU FAULT

AUTOMATIC ENGINE START

Ident.: PRO-NOR-SOP-08-00010162.0060001 / 31 AUG 17
Applicable to: MSN 01767, 02584, 03750, 04294, 04314, 04393-04438, 04510

Use the automatic engine start procedure in most circumstances. However, if the start aborts due to insufficient starter inlet air pressure (e.g. on high airfields, or in case of low pressure from an external pneumatic power group), it is recommended to use the manual start procedure, instead the automatic procedure.
If, during the engine start, the ground crew reports a fuel leak from the engine drain mast, run the engine at idle for 5 min. If the leak disappears during these 5 min, the aircraft can be dispatched without maintenance action. If the leak is still present after 5 min, shut down the engine and request the maintenance personnel to investigate the leakage source.

ENG MODE selector..... IGN/START

The lower ECAM displays the ENG SD page.

ENGINE 2 START.....ANNOUNCE

Engine 2 is usually started first. It powers the yellow hydraulic system, that pressurizes the parking brake.

ENG MASTER 2.....ON

- *Do not set the ENG MASTER 2 lever to ON before all amber crosses and messages have disappeared on the engine parameters (upper ECAM display).*
- *Parameter callouts are not mandatory.*
- *In case the electrical power supply is interrupted during the start sequence (indicated by the loss of ECAM DUs), abort the start by setting to OFF the ENG MASTER 2 lever. Then, perform a 30 s dry crank.*

ON ECAM UPPER DISPLAY	***ON ECAM LOWER DISPLAY***
N2 increases	*Corresponding start valve in line.* *Bleed pressure indication green.* *Oil pressure increases.*
At 16 % N2	*Indication of the active igniter (A or B).*
At 22 % N2 - *FF increases* *15 s (maximum) after fuel is on* - *EGT increases* - *N1 increases*	
At 50 % N2	*Start valve starts closing. (It is fully closed between 50 % and 56 % N2).* *Igniter indication off.*

- **When idle is reached (AVAIL indication is displayed):**

ENG IDLE PARAMETERS..... CHECK

At ISA sea level : N1 about 19.5 %
N2 about 58.5 %
EGT about 390 °C
FF about 275 kg/h (600 lb/h)

Grey background on N2 indication disappears.

ENGINE 1 START..... ANNOUNCE
ENG MASTER 1..... ON

Same procedure as for engine 2.
Both pack valves reopen with 30 s delay after the second engine N2 is above 50 %.

Note: A PTU FAULT is triggered, if the last engine is started within 40 s following the end of the cargo doors operation. Refer to PRO-ABN-HYD HYD PTU FAULT.

AUTOMATIC ENGINE START

Ident.: PRO-NOR-SOP-08-00010162.0002001 / 31 AUG 17
Applicable to: MSN 01920, 02388, 02712, 03138

Use the automatic engine start procedure in most circumstances. However, if the start aborts due to insufficient starter inlet air pressure (e.g. on high airfields, or in case of low pressure from an external pneumatic power group), it is recommended to use the manual start procedure, instead the automatic procedure.
If, during the engine start, the ground crew reports a fuel leak from the engine drain mast, run the engine at idle for 5 min. If the leak disappears during these 5 min, the aircraft can be dispatched without maintenance action. If the leak is still present after 5 min, shut down the engine and request the maintenance personnel to investigate the leakage source.

ENG MODE selector..... IGN/START

The lower ECAM displays the ENG SD page.

ENGINE 2 START..... ANNOUNCE

Engine 2 is usually started first. It powers the yellow hydraulic system, that pressurizes the parking brake.

ENG MASTER 2.....ON

- *Do not set the ENG MASTER 2 lever to ON before all amber crosses and messages have disappeared on the engine parameters (upper ECAM display).*
- *Parameter callouts are not mandatory.*
- *In case the electrical power supply is interrupted during the start sequence (indicated by the loss of ECAM DUs), abort the start by setting to OFF the ENG MASTER 2 lever. Then, perform a 30 s dry crank.*

ON ECAM UPPER DISPLAY	*ON ECAM LOWER DISPLAY*
N2 increases	*Corresponding start valve inline.* *Bleed pressure indication green.* *Oil pressure increases.*
At 16 % N2	*Indication of the active igniter (A or B).*
At 22 % N2 *- FF increases (1)* *15 s (maximum) after fuel is on* *- EGT increases* *- N1 increases*	
At 50 % N2	*Start valve starts closing. (It is fully closed between 50 % and 56 % N2).* *Igniter indication off.*

(1) With the current ECU standard, the FF indication may be crossed up to approximately 200 kg/h (440 lb/h).

ENG IDLE PARAMETERS.....CHECK

At ISA sea level : N1 about 19.5 %
N2 about 58.5 %
EGT about 390 °C
FF about 275 kg/h (600 lb/h)

Grey background on N2 indication disappears.

ENGINE 1 START.....ANNOUNCE
ENG MASTER 1.....ON

Same procedure as for engine 2.
Both pack valves reopen with 30 s delay after the second engine N2 is above 50 %.

Note: A PTU FAULT is triggered, if the last engine is started within 40 s following the end of the cargo doors operation. Refer to PRO-ABN-HYD HYD PTU FAULT.

AUTOMATIC ENGINE START

Ident.: PRO-NOR-SOP-08-00010162.0040001 / 31 AUG 17
Applicable to: MSN 02108, 02135, 02139-02359, 02405-02482, 02609-02670, 02804-02914, 03264-03618

Use the automatic engine start procedure in most circumstances. However, if the start aborts due to insufficient starter inlet air pressure (e.g. on high airfields, or in case of low pressure from an external pneumatic power group), it is recommended to use the manual start procedure, instead the automatic procedure.

ENG MODE selector..... IGN/START

The lower ECAM displays the ENG SD page.

ENGINE 2 START.....ANNOUNCE

Engine 2 is usually started first. It powers the yellow hydraulic system, that pressurizes the parking brake.

ENG MASTER 2.....ON

- *Do not set the ENG MASTER 2 lever to ON before all amber crosses, except on N1 and N2, and messages, have disappeared on the engine parameters (upper ECAM display).*
- *Parameter callouts are not mandatory.*
- *In case the electrical power supply is interrupted during the start sequence (indicated by the loss of ECAM DUs), abort the start by setting to OFF the ENG MASTER 2 lever. Then, perform a 30 s dry crank.*

ON ECAM UPPER DISPLAY	*ON ECAM LOWER DISPLAY*
N2 increases	*Corresponding start valve inline.* *Bleed pressure indication green.* *Oil pressure increases.*
30 s after ENG 2 MASTER sw is ON: *- FF increases.*	*Indication of the active igniter (A or B).*
20 s (maximum) after fuel is on *- EGT increases* *- N1 increases prior to 34 % N2.*	
At 43 % N2	*Igniter indication off.*
Slightly above 43 % N2	*Start valve crossline.*

Note: *When the FADEC detects an impending hung start or hot start, the FADEC applies an automatic recovery sequence without an ECAM message. The crew will notice that dual ignition (A+B) is applied, and that fuel will be commanded OFF, and then re-commanded ON within 0.5 s. It is not necessary for the crew to shut down the engine.*

ENG IDLE PARAMETERS.....CHECK

At ISA sea level : *N1 about 21.4 %*
N2 about 57.8 %
EPR about 1.01
EGT about 414 °C
FF about 350 kg/h (775 lb/h)

Grey background on N2 indication disappears.

ENGINE 1 START.....ANNOUNCE
ENG MASTER 1.....ON

Same procedure as for engine 2.
Both pack valves reopen with 30 s delay after the second engine N2 is above 50 %.

Note: A PTU FAULT is triggered, if the last engine is started within 40 s following the end of the cargo doors operation. *Refer to PRO-ABN-HYD HYD PTU FAULT.*

AUTOMATIC ENGINE START

Ident.: PRO-NOR-SOP-08-00010162.0056001 / 31 AUG 17

[2] **Applicable to: MSN 01957-02097, 02121, 02138, 02737, 03071, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-06336**

Use the automatic engine start procedure in most circumstances. However, if the start aborts due to insufficient starter inlet air pressure (e.g. on high airfields, or in case of low pressure from an external pneumatic power group), it is recommended to use the manual start procedure, instead the automatic procedure.

ENG MODE selector..... IGN/START

The lower ECAM displays the ENG SD page.

ENGINE 2 START.....ANNOUNCE

Engine 2 is usually started first. It powers the yellow hydraulic system, that pressurizes the parking brake.

ENG MASTER 2.....ON

- *Do not set the ENG MASTER 2 lever to ON before all amber crosses, except on N1 and N2, and messages, have disappeared on the engine parameters (upper ECAM display).*
- *Parameter callouts are not mandatory.*
- *In case the electrical power supply is interrupted during the start sequence (indicated by the loss of ECAM DUs), abort the start by setting to OFF the ENG MASTER 2 lever. Then, perform a 30 s dry crank.*

ON ECAM UPPER DISPLAY	ON ECAM LOWER DISPLAY
N2 increases	*Corresponding start valve inline.* *Bleed pressure indication green.* *Oil pressure increases.*
30 s after ENG 2 MASTER sw is ON: *- FF increases.*	*Indication of the active igniter (A or B).*
20 s (maximum) after fuel is on *- EGT increases* *- N1 increases prior to 34 % N2.*	
At 43 % N2	*Igniter indication off.*

Note: When the FADEC detects an impending hung start or hot start, the FADEC applies an automatic recovery sequence without an ECAM message. The crew will notice that dual ignition (A+B) is applied, and that fuel will be commanded OFF, and then re-commanded ON within 0.5 s. It is not necessary for the crew to shut down the engine.

- **When idle is reached (AVAIL indication is displayed):**

ENG IDLE PARAMETERS..... CHECK

At ISA sea level : EPR about 1.01
N1about 21.4 %
N2 about 57.8 %
EGT about 414 °C
FF about350 kg/h (775 lb/h)

ENGINE 1 START..... ANNOUNCE
ENG MASTER 1..... ON

Same procedure as for engine 2.

Note: A PTU FAULT is triggered, if the last engine is started within 40 s following the end of the cargo doors operation. Refer to PRO-ABN-HYD HYD PTU FAULT.

AUTOMATIC ENGINE START

Ident.: PRO-NOR-SOP-08-00010162.0065001 / 31 AUG 17

[3] **Applicable to: MSN 06772, 06829, 06904, 06946, 07083-07192, 07329-09063**
Impacted by TDU: 00022757 Automatic Engine Start

Use the automatic engine start procedure in most circumstances. However, if the start aborts due to insufficient starter inlet air pressure (e.g. on high airfields, or in case of low pressure from an external pneumatic power group), it is recommended to use the manual start procedure, instead the automatic procedure.

If, during the engine start, the ground crew reports a leak from the engine, abort the engine start sequence. Maintenance action is due before the flight.

ENG MODE selector.....IGN/START

The lower ECAM displays the ENG SD page. Depending on the engine thermal state, the FADEC can command an automatic dry cranking (engine cooling). In such case, when the ENG MODE selector is set to IGN/START, the indication COOLING is displayed on the E/WD for one, or both engines with the expected engine cooling time indicated. Refer to DSC-70-80-40 Engine Cooling

DUAL COOLING pb-sw.....AS RQRD

Setting the DUAL COOLING pb-sw to ON enables to arm the dual cooling function: When the ENG MASTER lever is set to ON, the FADEC commands an automatic dry cranking on both engines simultaneously (if cooling is required). This enhances the overall time to start the engines when cooling is required. When this function is armed, the memo DUAL COOLING is displayed on the E/WD.

ENGINE 2 START.....ANNOUNCE

Engine 2 is usually started first. It powers the yellow hydraulic system, that pressurizes the parking brake.

ENG MASTER 2.....ON

- *Do not set the ENG MASTER 2 lever to ON before all amber crosses and messages have disappeared on the engine parameters (upper ECAM display).*
- *Parameter callouts are not mandatory.*
- *In case the electrical power supply is interrupted during the start sequence (indicated by the loss of ECAM DUs), abort the start by setting to OFF the ENG MASTER 2 lever. Then, perform a 30 s dry crank.*
- *Depending of the engine thermal state, the FADEC can command an automatic dry cranking (or engine cooling) with the associated COOLING indication displayed on the E/WD. Refer to DSC-70-80-40 Engine Cooling*

Note: If the DUAL COOLING function is armed, the cooling will be performed on both engines simultaneously. In such case, the FADEC resumes the start sequence of ENG 2 once the cooling time indication is at zero for both engines.

ON ECAM UPPER DISPLAY	ON ECAM LOWER DISPLAY
N2 increases	Corresponding start valve inline. Bleed pressure indication green. Oil pressure increases.
At approximately 18 % N2: - FF increases.	Indication of the active igniter (A or B).

Continued on the following page

Continued from the previous page

ON ECAM UPPER DISPLAY	*ON ECAM LOWER DISPLAY*
20 s (maximum) after fuel is on *- EGT increases* *- N1 increases prior to 48 % N2.*	
At approximately 55 % N2	*Start valve crossline.* *Igniter indication off.*

Note: When the FADEC detects an impending hot start or stall, the FADEC applies an automatic recovery sequence without an ECAM message. The flight crew notices that fuel will be commanded OFF, and then re-commanded ON. It is not necessary for the flight crew to shut down the engine.

- **When idle is reached (AVAIL indication is displayed):**

ENG IDLE PARAMETERS..... CHECK

At ISA sea level : N1 about 19 %
N2 about 59 %
EGT about 550 °C
FF about 270 kg/h (600 lb/h)

ENGINE 1 START..... ANNOUNCE
ENG MASTER 1..... ON

Same procedure as for engine 2.

Note: - If dual cooling has been selected for engine start, the FADEC keeps in memory the cooling benefit for ENG 1 provided ENG 1 is started within 20 min after ENG 2 start. However, in any case, the FADEC commands an engine cooling before ENG 1 start.
- A PTU FAULT is triggered, if the last engine is started within 40 s following the end of the cargo doors operation. Refer to PRO-ABN-HYD HYD PTU FAULT.

AUTOMATIC ENGINE START

Ident.: PRO-NOR-SOP-08-00010162.0066001 / 31 AUG 17

ANTI-ICE

CAUTION	In icing conditions (*Refer to LIM-ICE_RAIN Definition of Icing Conditions*), the flight crew must turn on the engine anti-ice and should not wait until seeing ice building up.

ENG ANTI-ICE pb-sw..... AS RQRD

Engine anti-ice must be set to ON during all ground operations, when icing conditions exist or are anticipated.
During ground operation, when in icing conditions and the OAT is +3 °C or less, or if significant engine vibration occurs, the following procedure should be applied for ice shedding :

L2 *Note:*
1. *The flight crew must consider the taxi-in time from the previous flight and the taxi-out time of the current flight to determine the total taxi time.*
2. *If a maintenance task to de-ice the engines was performed before engine start, the taxi-in time of the previous flight must be disregarded.*
3. *For taxi-in time, Refer to PRO-NOR-SOP-22 Parking - Icing Conditions.*

L1

CAUTION	*If, during thrust increase, the aircraft starts to move, immediately retard the thrust levers to IDLE.*

If ground surface conditions and the environment permit, the flight crew should set parking brake to ON or brake with pedals and accelerate the engines to minimum 60 % of N1.
Engine accelerations should be performed at intervals not greater than:

- *30 min if OAT is below +3 °C but above -9 °C.*
- *120 min if OAT is below -9 °C.*

There is no requirement to maintain the high thrust settings.
In addition, this engine acceleration should also be performed just before take-off, with particular attention to engine parameters to ensure normal engine operation.
If the ground surface conditions or the environment do not permit, the flight crew must request maintenance action for manual engine deicing.

Ident.: PRO-NOR-SOP-09-A-00010212.0004001 / 04 DEC 18

5 **Applicable to: MSN 01957-02359, 02405-02482, 02609-02670, 02737-03071, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-06336**

ANTI-ICE

CAUTION	In icing conditions (*Refer to LIM-ICE_RAIN Definition of Icing Conditions*), the flight crew must turn on the engine anti-ice and should not wait until seeing ice building up.

ENG ANTI-ICE pb-sw..... AS RQRD

Engine anti-ice must be set to ON during all ground operations, when icing conditions exist or are anticipated.
During ground operation, when in icing conditions and the OAT is +3 °C or less, or if significant engine vibration occurs, the following procedure should be applied for ice shedding :

L2 *Note:*
1. *The flight crew must consider the taxi-in time from the previous flight and the taxi-out time of the current flight to determine the total taxi time.*
2. *If a maintenance task to de-ice the engines was performed before engine start, the taxi-in time of the previous flight must be disregarded.*
3. *For taxi-in time, Refer to PRO-NOR-SOP-22 Parking - Icing Conditions.*

L1

CAUTION	*If, during thrust increase, the aircraft starts to move, immediately retard the thrust levers to IDLE.*

If ground surface conditions and the environment permit, the flight crew should accelerate the engines to minimum 50 % of N1 at intervals not greater than 15 min. There is no requirement to maintain the high trust settings.
In addition, this engine acceleration should also be performed just before take-off, with particular attention to engine parameters to ensure normal engine operation.

Note: When performing the static run–up, the 61-74 % N1 range should be avoided.

If ENG ANTI ICE is selected ON and the valve(s) do not open (FAULT light(s) remain on), increase the N2 of the associated engine by about 5 %.
When the valves are open, retard the thrust lever(s) to idle.

If ENG ANTI ICE is switched on, the IGNITION memo appears on the ECAM because continuous ignition is automatically selected.

Ident.: PRO-NOR-SOP-09-A-00010212.0005001 / 04 DEC 18
Applicable to: MSN 01767-01920, 02388, 02584, 02712, 03138, 03750, 04294, 04314, 04393-04438, 04510

ANTI-ICE

CAUTION	In icing conditions (*Refer to LIM-ICE_RAIN Definition of Icing Conditions*), the flight crew must turn on the engine anti-ice and should not wait until seeing ice building up.

ENG ANTI-ICE pb-sw..... AS RQRD

Engine anti-ice must be set to ON during all ground operation, when icing conditions exist or are anticipated.
During ground operation, when in icing conditions and the OAT is +3 °C or less for more than 30 min, the following procedure should be applied for ice shedding:

L2 *Note:*
1. *The flight crew must consider the taxi-in time from the previous flight and the taxi-out time of the current flight to determine the total taxi time.*
2. *If a maintenance task to de-ice the engines was performed before engine start, the taxi-in time of the previous flight must be disregarded.*
3. *For taxi-in time, Refer to PRO-NOR-SOP-22 Parking - Icing Conditions.*

L1

CAUTION	*If, during thrust increase, the aircraft starts to move, immediately retard the thrust levers to IDLE.*

If ground surface conditions and the environment permit, the flight crew should accelerate the engines to approximately 70 % of N1 for 30 s at intervals not greater than 30 min.
In addition, this engine acceleration should also be performed just before take-off, with particular attention to engine parameters to ensure normal engine operation. If ground surface or environment do not permit to accelerate the engine to 70 % N1, then power setting and dwell time should be as high as practical.
When operating in conditions of freezing rain, freezing drizzle, freezing fog or heavy snow, ice shedding may be enhanced, by additional run ups at intervals, to not exceed 10 min, advancing throttles to 70 % N1 momentarily (no hold time).

Impacted DU: 00015298 Taxi - Radar

RADAR..... ON

To check the radar and the departure path, set the MULTISCAN sw to MAN. The flight crew can then set the radar to the AUTO position.
Gain must be manually set to +4, when MULTISCAN selector is set to AUTO and when flying below FL 200.

Note:
1. *If the weather is good, or not significant, in order to check that the radar is operating correctly: down tilt until displaying ground echoes*
2. *If the weather display is ambiguous or unexpected, in order to better analyze the weather situation, use manual tilt according to standard technique.*
3. *In particular below FL 200, for situations with low-level weather, weather with low reflectivity or in front of suspected active cells, the flight crew should switch to Manual mode and adjust the tilt setting downward until the weather is detected or the ground clutter appears on the upper part of the display.*
4. *In addition, the flight crew may increase the manual gain control to display lower reflectivity targets. The manual gain control can be increased in both AUTO and Manual modes to display lower levels of weather. In both cases, ground clutter may also be displayed as a result of low settings and/or increased gain.*

PACK 1 and 2.....AS RQRD

Consider selecting packs OFF, or APU bleed ON.
This will improve performance when using TOGA thrust.
In case of a FLEX takeoff, selecting packs OFF or APU bleed ON will reduce takeoff EGT, and thus reduce maintenance costs.
The use of flex thrust may reduce maintenance costs. The effect is particularly significant with the first degrees of FLEX.
Use of APU bleed is not authorized, if wing anti-ice is to be used.

THRUST SETTING

The below procedure is the standard takeoff procedure. However, rolling takeoff is permitted.

TAKEOFF..... ANNOUNCE
THRUST LEVERS.....50 % N1 (1.05 EPR)

- **If the crosswind is at or below 20 kt and there is no tailwind:**

  To counter the nose-up effect of setting engine takeoff thrust, apply half forward sidestick until the airspeed reaches 80 kt. Release the sidestick gradually to reach neutral at 100 kt.

  BRAKES.....RELEASE
  THRUST LEVERS..... FLX or TOGA

  Once the thrust levers are set to FLX or TOGA detent, the Captain keeps his hand on the thrust levers until the aircraft reaches V1.

- **In case of tailwind, or if crosswind is greater than 20 kt:**

  The PF applies full forward sidestick.

  BRAKES.....RELEASE

THRUST LEVERS..... FLX or TOGA

- *The PF increases thrust progressively to reach takeoff thrust by 40 kt ground speed, while maintaining sidestick full forward up to 80 kt. Release the sidestick gradually to reach neutral at 100 kt.*
- *Once the thrust levers are set to FLX or TOGA detent, the Captain keeps his hand on the thrust levers until the aircraft reaches V1.*

Note: 1. ENG SD page replaces WHEEL SD page on the ECAM lower display
2. The FADEC includes a keep-out zone, which is designed to avoid steady state operation inside a N1 range between 60 % and 74 % due to fan flutter phenomenon. This can result in discontinuous EPR increase during thrust setting (Refer to DSC-70-20 Functions).

DIRECTIONAL CONTROL..... USE RUDDER

At 130 kt (wheel speed), the connection between nosewheel steering and the rudder pedals is removed. Therefore, in strong crosswinds, more rudder input will be required at this point to prevent the aircraft from turning into the wind.

CHRONO.....START
PFD/ND..... MONITOR

1. Check the FMA on the PFD. The following modes are displayed: MAN TOGA (or MAN FLX xx) /SRS/RWY (or blank) / A/THR (in blue).

Note: If an ILS that corresponds to the departure runway is tuned, RWY mode appears. If not, no lateral mode appears until the aircraft lifts off.

2. Check the FMS position on the ND (aircraft on runway centerline).

Note: If GPS PRIMARY is not available, check the FMS position update.

Applicable to: ALL

AT VR

ROTATION .....ORDER

ROTATION.....PERFORM

- *At VR, initiate the rotation to achieve a continuous rotation with a rate of about 3 °/s, towards a pitch attitude 15 ° (12.5 °, one engine is failed)*
- *Minimize the lateral inputs on ground and during the rotation, to avoid spoiler extension*
- *In strong crosswind conditions, small lateral stick inputs may be used, if necessary, to aim at maintaining wings level*
- *After lift-off, follow the SRS pitch command bar.*

CAUTION	If a tailstrike occurs, avoid flying at an altitude requiring a pressurized cabin, and return to the originating airport for damage assessment.

Ident.: PRO-NOR-SOP-12-A-00011565.0001001 / 04 MAR 14

WHEN POSITIVE CLIMB

POSITIVE CLIMB.....ANNOUNCE
L/G UP..... ORDER
L/G..... SELECT UP
AP.....AS RQRD

Above 100 ft AGL, AP 1 or 2 may be engaged.

Ident.: PRO-NOR-SOP-12-A-00011566.0002001 / 28 JUL 15
Applicable to: ALL

AT THRUST REDUCTION ALTITUDE

THRUST LEVERS.....CL

Move the thrust levers to the CL detent, when the flashing LVR CLB prompt appears on the FMA. A/THR is now active.
In manual flight, the pilot must anticipate the change in pitch attitude in order to prevent the speed from decaying when thrust is reduced.

PACK 1 and 2 (if applicable)..... ON

Select PACK 1 on after CLB thrust reduction.
Select PACK 2, at least 10 s after PACK 1 is selected on, for passenger comfort.

Note: *1. Selecting pack on before reducing takeoff thrust would result in an EGT increase.*
2. If packs are not switched on after the takeoff phase, an ECAM caution will be triggered.

Ident.: PRO-NOR-SOP-12-A-00011567.0002001 / 04 MAR 14
Applicable to: ALL

AT ACCELERATION ALTITUDE

Check the target speed change from V2 + 10 to the first CLB speed (either preselected or managed).

Note: *1. When THR RED and ACC ALT are equal, the FMA will change from MAN FLX/SRS/NAV to THR CLB/CLB/NAV.*
2. If FCU-selected altitude is equal to or close to the acceleration altitude, then the FMA will switch from SRS to ALT.*

Applicable to: ALL

AFTER TAKEOFF/CLIMB CHECKLIST down to the line..... COMPLETE

CLIMB

Ident.: PRO-NOR-SOP-14-A-00010245.0002001 / 05 DEC 17
Applicable to: MSN 01767-03071, 03264-04384, 04399-05365, 06720-09063
Impacted by TDU: 00013057 Climb - Initial Climb

Normal vertical mode is CLB or OP CLB with managed speed active.

PF MCDU.....PERF CLB

- *PF MCDU should be showing the PERF CLB page (allowing PF to monitor when the aircraft will reach the FCU selected altitude) but he may select other pages such as F-PLN page as may be tactically necessary.*
- *The MCDU PROG page displays OPT FL and MAX REC FL. It is worth noting that this OPT FL is a function of the cost index (CI).*
- *The displayed MAX REC FL gives the aircraft at least a 0.3 g buffet margin. The pilot may enter a cruise flight level above this level into the MCDU and the FMGS will accept it, provided that it does not exceed the level at which the margin is reduced to 0.2 g.*

PM MCDU.....F-PLN

PM MCDU should be showing the F-PLN page (allowing him to enter any ATC long-term revisions to the lateral or vertical flight plan).

CLIMB SPEED MODIFICATIONS

- **If ATC, turbulence or operational considerations lead to a speed change:**
  Select the new speed with FCU SPD knob and pull.

  Speed target is now "selected".

  To return to managed speed mode, push FCU SPD knob.

  The speed target is now "managed".

  Note: The best speed (and rate of climb) for long-term situations lies between green dot speed and ECON speed. At high altitude, acceleration from green dot to ECON speed can take a long time.

EXPEDITE CLIMB

- **If ATC requires a rapid climb through a particular level:**
  Push the EXP pb on the FCU.

  The target speed is now green dot speed. FMA :THR CLB /EXP CLB/NAV

Note: Use EXP ◁ only for short-term tactical situations. For the best overall economy fly at ECON IAS.

To return to ECON CLB speed:
Push ALT knob.
Check FMA: THR CLB/CLB/NAV

BAROMETRIC REFERENCE..... SET STD/CROSSCHECK

At transition altitude (baro setting flashing on PFD) set STD on the EFIS control panel and standby altimeter.
Cross-check baro settings and altitude readings.

CRZ FL..... SET AS RQRD

- *If ATC clears the aircraft to its intended CRZ FL or above, there is no need to modify the CRZ FL entered in the INIT A page during cockpit preparation. The MCDU will automatically take into account a higher CRZ FL selected with the FCU ALT knob.*
- *If ATC limits CRZ FL to a lower level than the one entered in the INIT A page (or present on the PROG page) the flight crew must insert this lower CRZ FL in the PROG page.*
  Otherwise there is no transition into CRZ phase : the managed speed targets and Mach are not modified, and SOFT ALT mode is not available. In that case FMA will display: MACH/ALT/NAV instead of MACH/ALT CRZ/NAV.

Ident.: PRO-NOR-SOP-14-A-00010245.0002001 / 05 DEC 17
Applicable to: MSN 03138, 04393-04397, 05411-06336

Normal vertical mode is CLB or OP CLB with managed speed active.

PF MCDU.....PERF CLB

- *PF MCDU should be showing the PERF CLB page (allowing PF to monitor when the aircraft will reach the FCU selected altitude) but he may select other pages such as F-PLN page as may be tactically necessary.*
- *The MCDU PROG page displays OPT FL and MAX REC FL. It is worth noting that this OPT FL is a function of the cost index (CI).*
- *The displayed MAX REC FL gives the aircraft at least a 0.3 g buffet margin. The pilot may enter a cruise flight level above this level into the MCDU and the FMGS will accept it, provided that it does not exceed the level at which the margin is reduced to 0.2 g.*

PM MCDU..... F-PLN

PM MCDU should be showing the F-PLN page (allowing him to enter any ATC long-term revisions to the lateral or vertical flight plan).

CLIMB SPEED MODIFICATIONS

- **If ATC, turbulence or operational considerations lead to a speed change:**
  Select the new speed with FCU SPD knob and pull.

  Speed target is now "selected".

  To return to managed speed mode, push FCU SPD knob.

  The speed target is now "managed".

  Note: *The best speed (and rate of climb) for long-term situations lies between green dot speed and ECON speed. At high altitude, acceleration from green dot to ECON speed can take a long time.*

EXPEDITE CLIMB ⩤

- **If ATC requires a rapid climb through a particular level:**
  Push the EXP pb on the FCU.

  The target speed is now green dot speed. FMA :THR CLB /EXP CLB/NAV

  Note: *Use EXP ⩤ only for short-term tactical situations. For the best overall economy fly at ECON IAS.*

  To return to ECON CLB speed:
  Push ALT knob.
  Check FMA: THR CLB/CLB/NAV

BAROMETRIC REFERENCE..... SET STD/CROSSCHECK

At transition altitude (baro setting flashing on PFD) set STD on the EFIS control panel and standby altimeter.
Cross-check baro settings and altitude readings.

CRZ FL..... SET AS RQRD

- *If ATC clears the aircraft to its intended CRZ FL or above, there is no need to modify the CRZ FL entered in the INIT A page during cockpit preparation. The MCDU will automatically take into account a higher CRZ FL selected with the FCU ALT knob.*
- *If ATC limits CRZ FL to a lower level than the one entered in the INIT A page (or present on the PROG page) the flight crew must insert this lower CRZ FL in the PROG page.*
  Otherwise there is no transition into CRZ phase : the managed speed targets and Mach are not modified, and SOFT ALT mode is not available. In that case FMA will display: MACH/ALT/NAV instead of MACH/ALT CRZ/NAV.

1 **Applicable to: MSN 01767-03071, 03264-04384, 04399-05365, 06720-09063**
Impacted DU: 00010245 Climb - Initial Climb

Normal vertical mode is CLB or OP CLB with managed speed active.
PF MCDU.....PERF CLB

- *PF MCDU should be showing the PERF CLB page (allowing PF to monitor when the aircraft will reach the FCU selected altitude) but he may select other pages such as F-PLN page as may be tactically necessary.*
- *The MCDU PROG page displays OPT FL and MAX REC FL. It is worth noting that this OPT FL is a function of the cost index (CI).*
- *The displayed MAX REC FL gives the aircraft at least a 0.3 g buffet margin. The pilot may enter a cruise flight level above this level into the MCDU and the FMGS will accept it, provided that it does not exceed the level at which the margin is reduced to 0.2 g.*

PM MCDU..... F-PLN

PM MCDU should be showing the F-PLN page (allowing him to enter any ATC long-term revisions to the lateral or vertical flight plan).

CLIMB SPEED MODIFICATIONS

- **If ATC, turbulence or operational considerations lead to a speed change:**
  Select the new speed with FCU SPD knob and pull.

  Speed target is now “selected”.

  To return to managed speed mode, push FCU SPD knob.

  The speed target is now “managed”.

  Note: *The best speed (and rate of climb) for long-term situations lies between green dot speed and ECON speed. At high altitude, acceleration from green dot to ECON speed can take a long time.*

EXPEDITE CLIMB ⩤

- **If ATC requires a rapid climb through a particular level:**
  Push the EXP pb on the FCU.

  The target speed is now green dot speed. FMA :THR CLB /EXP CLB/NAV

  Note: *Use EXP ⩤ only for short-term tactical situations. For the best overall economy fly at ECON IAS.*

  To return to ECON CLB speed:
  Push ALT knob.
  Check FMA: THR CLB/CLB/NAV

BAROMETRIC REFERENCE..... SET STD/CROSSCHECK

At transition altitude (baro setting flashing on PFD) set STD on the EFIS control panel and standby altimeter.
Cross-check baro settings and altitude readings.

Note: When STD is set on the EFIS control panel, the transponder does not transmit to the Air Traffic Control (ATC) the standard barometric reference but the last QNH or QFE previously selected. The transmitted aircraft altitude is not affected. Only the FCU selected altitude, if used by the ATC, may be misinterpreted.
Upon ATC notification of an incorrect barometric reference value, the flight crew can select manually a barometric reference of 1 013 hPa and set again STD on the EFIS control panel.

CRZ FL..... SET AS RQRD

- *If ATC clears the aircraft to its intended CRZ FL or above, there is no need to modify the CRZ FL entered in the INIT A page during cockpit preparation. The MCDU will automatically take into account a higher CRZ FL selected with the FCU ALT knob.*
- *If ATC limits CRZ FL to a lower level than the one entered in the INIT A page (or present on the PROG page) the flight crew must insert this lower CRZ FL in the PROG page.*
  Otherwise there is no transition into CRZ phase : the managed speed targets and Mach are not modified, and SOFT ALT mode is not available. In that case FMA will display: MACH/ALT/NAV instead of MACH/ALT CRZ/NAV.

Impacted DU: 00010259 Climb - Radar

RADAR..... AS APPROPRIATE

Gain must be manually set to +4, when MULTISCAN selector is set to AUTO and when flying below FL 200.

Note: 1. *If the weather is good, or not significant, in order to check that the radar is operating correctly: down tilt until displaying ground echoes.*
2. *If the weather display is ambiguous or unexpected, in order to better analyze the weather situation, use manual tilt according to standard technique.*
3. *In particular below FL 200, for situations with low-level weather, weather with low reflectivity or in front of suspected active cells, the flight crew should switch to Manual mode and adjust the tilt setting downward until the weather is detected or the ground clutter appears on the upper part of the display.*
4. *In addition, the flight crew may increase the manual gain control to display lower reflectivity targets. The manual gain control can be increased in both AUTO and Manual modes to display lower levels of weather. In both cases, ground clutter may also be displayed as a result of low settings and/or increased gain.*

Applicable to: ALL

FLIGHT PROGRESS..... CHECK

Monitor flight progress in the conventional way.

When overflying a waypoint:

- *Check track and distance to the next waypoint.*

When overflying the waypoint, or at least every 30 min:

- *Check FUEL : Check FOB (ECAM), and fuel prediction (FMGC), and compare with the computer flight plan or the in-cruise quick-check table (Refer to QRH/PER-M In Cruise Quick Check at a Given Mach Number (Paper Only) or use the performance application of FlySmart with Airbus). Check that the sum of the fuel on board and the fuel used is consistent with the fuel on board at departure. If the sum is unusually greater than the fuel on board at departure, suspect a fuel quantity over read. If the sum is unusually smaller than the fuel on board at departure, or if it decreases, suspect a fuel leak.*
  For more information about fuel leak, Refer to FCTM/PR-AEP-FUEL Fuel Leak.

CAUTION	*This check must also be performed each time a FUEL IMBALANCE procedure is necessary. Perform the check before applying the FUEL IMBALANCE procedure. If a fuel leak is confirmed, apply the FUEL LEAK procedure.*

NAV ACCURACY.....MONITOR

On aircraft equipped with GPS primary, no navigation accuracy check is required, as long as GPS PRIMARY is available.

Otherwise, a navigation accuracy check must be performed especially when any of the following occurs:

- *GPS PRIMARY LOST appears on the ND (GPS ◁)*
- *IRS only navigation*
- *The PROG page displays LOW accuracy*
- *"NAV ACCUR DOWNGRAD" appears on the MCDU.*

Refer to DSC-22_20-20-20 Estimated Position Uncertainty.

Note: Methods for checking accuracy:

- ***If the check is positive (error ≤ 3 N.m): FM position is reliable.***
  Use ND (ARC or NAV) and managed lateral guidance.
- ***If the check is negative (error > 3 N.m): FM position is not reliable.***
  Use raw data for navigation and monitor it.
  - ***If there is a significant mismatch between the display and the real position:***
    Disengage MANAGED NAV mode and use raw data navigation (possibly switching to ROSE VOR, so as not to be misled by FM data).

  OXYGEN MASK .....CHECK

  Check that the oxygen mask has been properly stowed, Refer to DSC-35-20-10 General.

Intentionally left blank

DESCENT PREPARATION

Ident.: PRO-NOR-SOP-16-A-00011551.0001001 / 30 JUN 14
Applicable to: ALL

Descent preparation and approach briefing should be completed before top of descent.

Ident.: PRO-NOR-SOP-16-A-00011552.0006001 / 20 MAR 17
Applicable to: ALL

WEATHER AND LANDING INFORMATION.....OBTAIN

Check weather reports at ALTERNATE and DESTINATION airports. Airfield data should include runway in use for arrival.

Note: *When operating in cold weather conditions, consider altitude correction. Refer to PER-OPD-GEN ALTITUDE TEMPERATURE CORRECTION.*

NAV CHARTS CLIPBOARD.....PREPARE

Ident.: PRO-NOR-SOP-16-A-00014394.0001001 / 05 DEC 17
Applicable to: ALL

LDG PERFORMANCE..... CHECK

Perform an in-flight landing performance assessment if the landing conditions changed compared with the landing computation at dispatch, or with a previous computation (e.g. runway, weather conditions, in-flight failure affecting performance, diversion).

Note:
1. *If the weather conditions are expected to change at the landing airport, or in the event of significant precipitation, the flight crew should consider a second calculation of the in-flight landing distance with the worst possible runway condition.*
2. *The selection of REV MAX is the standard practice for landing.*
   However, on dry runways the flight crew may select REV IDLE.
   On WET runways (runway surface condition GOOD), the flight crew may select REV IDLE, if all the following conditions are satisfied:
   - *A landing distance assessment has been made with the following parameters:*
     - *MEDIUM TO POOR landing performance level for the in-flight landing distance computation*
     - *No reverser credit*
   - *The result of this landing distance assessment is within the LDA.*

- **If landing conditions changed:**

LDG PERFORMANCE..... COMPUTE

In the LDG PERF application, modify the selections in accordance with the estimated arrival conditions:

- *In the AIRPORT/RUNWAY part, select the applicable runway*
- *In the CONDITIONS part, enter the estimated landing conditions*
- *In the AIRCRAFT STATUS part, check the selected items, if any*
- *Launch the computation and check the results versus Airline policy or applicable regulations.*

LDG PERFORMANCE.....CHECK

Ident.: PRO-NOR-SOP-16-A-00020100.0001001 / 17 MAY 17
Applicable to: ALL

ARRIVAL page..... COMPLETE/CHECK

Insert APPR, STAR, APPR VIA and TRANS if applicable. (Access by lateral revision at destination.)

F-PLN A page..... CHECK

- *Ensure that the inserted F-PLN agrees with planned approach and missed approach.*
- *Use the scroll key to check the F-PLN thoroughly, using ND in PLAN mode as necessary.*

Tracks and distances between waypoints are displayed on the second line from the top of the MCDU. Approach and Missed Approach tracks and distances must be checked from the appropriate navigation charts.

- *Check speed constraints. Add new speed constraints if required.*
- *Check altitude constraints. Add new altitude constraints if required.*

  Note: *The FMS may have deleted the altitude constraints that are at or above the CRZ FL, or at or above any previous lower CRZ FL in the case of step climbs (Refer to DSC-22_20-30-20-05 Vertical Constraints (Speed, Altitude, Time)).*

  In that case,
  - *Insert again the affected procedures (STAR, APPR VIA or TRANS)*
    The FMS keeps the altitude constraints that are below the CRZ FL, and deletes again the altitude constraints that are above current CRZ FL. The FMS may also delete the altitude constraints that are at current CRZ FL, and the altitude constraint windows that have a constraint at or above current CRZ FL.
  - *Manually enter the altitude constraints that are below current CRZ FL using the MCDU Vertical Revision pages.*
    It is not possible to enter an altitude constraint at the CRZ FL.
    In the case of an "AT" or "AT OR ABOVE" altitude constraint at the CRZ FL, the flight crew must select the DES mode only after the aircraft reaches the position of the altitude constraint to prevent an early descent..

- *In all cases, do not modify the final approach (FAF to runway or MAP), including altitude constraints.*
- *Identify the position and the altitude of Final Descent Point (FDP) and check the value of the FPA after this FDP,*
- *If a TOO STEEP PATH message is displayed after the FDP, do not use FINAL APP guidance for approach.*
- *Identify the Missed Approach Point.*

CAUTION	In icing conditions (*Refer to LIM-ICE_RAIN Definition of Icing Conditions*), the flight crew must turn on the engine anti-ice and should not wait until seeing ice building up.

ENG ANTI-ICE pb-sw.....AS RQRD

Engine anti-ice must be set to ON before and during descent, even If the SAT is below -40 °C (-40 °F).

When ENG ANTI ICE is ON, the FADEC automatically controls continuous ignition and selects a higher idle thrust which gives better protection against flame-out. The IGNITION memo appears on the ECAM.

WING ANTI ICE pb-sw.....AS RQRD

When icing conditions are encountered:

- *The flight crew may turn on the wing anti-ice to prevent the ice accretion on the wing leading edge.*
- *The flight crew must turn on the wing anti-ice if there is evidence of ice accretion, such as ice on the visual indicators, or on the wipers, or with the SEVERE ICE DETECTED alert. This is to remove any ice accumulation on the wing leading edge.*

ANTI ICE ON reduces the descent path angle (when the engines are at idle). The pilot can compensate for this by increasing the descent speed, or by extending up to half speedbrakes.

- *The flight crew must turn on the wing anti-ice if there is evidence of ice accretion, such as ice on the visual indicators, or on the wipers, or with the SEVERE ICE DETECTED alert. This is to remove any ice accumulation from the wing leading edge.*

ANTI ICE ON reduces the descent path angle (when the engines are at idle). The pilot can compensate for this by increasing the descent speed, or by extending up to half speedbrakes.

Ident.: PRO-NOR-SOP-16-A-00011557.0001001 / 03 MAR 14

Applicable to: ALL

DESCENT CLEARANCE.....OBTAIN
CLEARED ALTITUDE ON FCU..... SET

When clearance is obtained, set the ATC-cleared altitude (FL) on the FCU (also considering what is the safe altitude).

If the lowest safe altitude is higher than the ATC-cleared altitude, check with the ATC that this constraint applies.

If it is confirmed, set the FCU altitude to the safe altitude, until it is safe to go to the ATC-cleared altitude.

Intentionally left blank

DESCENT INITIATION

Ident.: PRO-NOR-SOP-17-00011541.0001001 / 03 NOV 14
Applicable to: ALL

DESCENT..... INITIATE

The normal method of initiating the descent is to select DES mode at the FMGS calculated top of descent (T/D).

■ **If ATC requires an early descent:**

Use DES mode which will guide the aircraft down at a lower vertical speed in order to converge on the required descent path. (The pilot may use a V/S of -1 000 ft/min).

■ **If ATC delays the descent:**

Beyond T/D, the PFD and the MCDU display either "DECELERATE" or "T/D REACHED" message. This suggests to the crew that it starts reducing speed towards green dot speed (with ATC permission). When cleared to descend, select DES mode with managed speed active.

DESCENT MONITORING

Ident.: PRO-NOR-SOP-17-00011542.0003001 / 23 DEC 14
Applicable to: ALL

PF MCDU.....PROG/PERF DES

PF MCDU should be set to PROG or PERF DES page:
- *PROG page in order to get VDEV or RQD DIST TO LAND/DIRECT DIST TO DEST information*
- *PERF DES in order to get predictions down to any inserted altitude in DES/OP DES modes and EXP mode ◁ .*

PM MCDU..... F-PLN
DESCENT..... MONITOR/ADJUST

Refer to PRO-NOR-SRP-01-60 Descent Monitoring - DES Mode Engaged

- *When flying in NAV mode, use DES mode.*
  The aircraft descends along the descent flight path: the PFD and PROG page display VDEV, and so it can be monitored. All constraints of the flight plan are taken into account for the guidance.
- *When the aircraft is flying in HDG or TRK mode, and thus out of the lateral F-PLN, DES mode is not available.*
  The NDs show a level-off symbol along the flight path. Its position is based on the current active modes .AP/FD and A/THR
  The flight crew can use this symbol to monitor the descent.
  MCDU predictions assume a return to the lateral F-PLN and descent flight path.
  Note that whenever the lateral mode is changed from NAV to HDG/TRK the vertical mode reverts to V/S at the value pertaining at the time of the mode change.
- *From time to time during stabilized descent, the flight crew may select FPA to check that the remaining distance to destination is approximately the altitude change required divided by the FPA in degrees.*

FPA (°) = ΔFL/DIST (NM)

DESCENT ADJUSTMENT

Ident.: PRO-NOR-SOP-17-A-00011543.0002001 / 09 MAR 15
Applicable to: ALL

To increase the rate of descent:

- Increase descent speed (by use of selected speed) if comfort and ATC permit. It is economically better (Time/Fuel) than the following procedures.
- Maintain high speed as long as possible. (SPD LIM may be suspended, subject to ATC clearance).
- If the aircraft is high and at high speed, it is more efficient to keep the high speed to ALT* and decelerate, rather than to mix descent and deceleration.
- If the aircraft goes below the desired profile, use SPEED and the V/S mode to adjust the rate of descent.

Note: *EXPEDITE DESCENT.*
If a high rate of descent is required, push the EXPED pushbutton on the FCU. The target speed for the descent now becomes M 0.8 or 340 kt, whichever is lower. The FMA will display THRIDLE/EXP DES/NAV.
To return to DES mode, push the FCU ALT knob.
To return to SPEED/V/S modes, pull the FCU V/S knob.
In all cases, monitor the FMA to ensure that the mode engages properly.

Ident.: PRO-NOR-SOP-17-A-00011544.0001001 / 03 MAR 14
Applicable to: ALL

If engine anti-ice is selected in descent, the flight idle is increased. So, to maintain the rate of descent that the airplane had before engine anti-ice selection it may be necessary to use up to half speedbrakes to maintain the required rate of descent, in OPEN DES vertical mode. If the rate of descent has to be increased, full speedbrakes may be used.
In DES mode: If the aircraft is on, or below, the flight path and the ATC requires a higher rate of descent, do not use speedbrakes because the rate of descent is dictated by the planned flight path. Thus, the A/THR may increase thrust to compensate for the increase in drag. In this case, use OPEN DES with speedbrakes.

Note: *1. If speedbrakes are used above 315 kt/M .75, with the AP engaged, their rate of retraction is low (total time for retraction from full extension is approximately 25 s). The ECAM memo page displays SPD BRAKES in amber until retraction is complete.*
2. In order to avoid overshooting the altitude, due to speedbrake retraction in ALT mode, retract the speedbrakes at least 2 000 ft before the selected altitude.*

BAROMETRIC REFERENCE.....SET

Set QNH (or QFE) on the EFIS control panel and on the standby altimeter, when approaching the transition level and when cleared for an altitude.
Crosscheck BARO settings and altitude readings.

Ident.: PRO-NOR-SOP-17-A-00011548.0001001 / 13 AUG 10
Applicable to: ALL

ECAM STATUS.....CHECK

- *Check that there is no status reminder on the upper ECAM display.*
- *If there is a status reminder, check the aircraft STATUS.*
- *Check the ECAM status page before completing the approach checks. Take particular note of any degradation in landing capability, or any other aspect affecting the approach and landing.*

Ident.: PRO-NOR-SOP-17-A-00021715.0001001 / 04 SEP 17
Applicable to: ALL

AT 10 000 FT

LAND lights selector..... SET

LAND lights may be switched ON, according to the airline policy/regulatory recommendations.

SEAT BELTS sw..... ON

EFIS option pb..... CSTR

Select CSTR on both sides.

ILS/LS pb.....AS RQRD

Press the ILS/LS pb, if one of the following approaches is planned:
- *ILS, GLS ◁ , MLS ◁*
- *ILS G/S out, LOC only or LOC B/C ◁*
- *Approach with the FLS function ◁*

The flight crew checks that:
- *Deviation scales are displayed on the PFD*
- *The IDENT is properly displayed on the PFD*

RAD NAVAIDS.....SELECTED/IDENTIFIED

Ensure that appropriate radio NAVAIDS are tuned and identified.
For NDB approaches, manually select the reference NAVAID.

Ident.: PRO-NOR-SOP-17-A-00015500.0001001 / 03 MAR 14
2 **Applicable to: MSN 01767-06336**

ENG MODE selector.....AS RQRD

- *Select IGN if the runway is covered with standing water, or if heavy rain or severe turbulence is expected during approach or go-around area.*

Ident.: PRO-NOR-SOP-17-A-00015501.0001001 / 03 MAR 14
Applicable to: ALL

NAV ACCURACY.....CHECK

On aircraft equipped with GPS primary, no navigation accuracy check is required, as long as GPS PRIMARY function is available.
Otherwise, crosscheck NAV ACCURACY using the PROG page (BRG/DIST computed data), and the ND (VOR/DME raw data).

APPROACH CHECKLIST

Approach General

INTRODUCTION

Ident.: PRO-NOR-SOP-18-A-00014490.0001001 / 29 MAY 13
Applicable to: ALL

The APPROACH section provides the standard operating procedures for the following approach types:

- ILS / MLS ◁ / GLS ◁ approaches
- Conventional approaches: VOR, VOR-DME, NDB, NDB-DME
- Approaches based on a LOC signal without any G/S signal: LOC ONLY, ILS G/S OUT, LOC B/C
- RNAV approaches including:
  - RNAV(GNSS) approaches with LNAV minimum or LNAV/VNAV minimum
  - RNAV(RNP) approaches for which Authorization is Required (AR) - If capability installed.

Note: *In relation to the names in the ICAO Performance-Based Navigation (PBN) Manual:*
- *"RNP APCH operations" corresponds to RNAV(GNSS) approaches*
- *"RNP AR APCH operations" corresponds to RNAV(RNP) approaches.*

CROSS-REFERENCE TABLE

Ident.: PRO-NOR-SOP-18-A-00014489.0001001 / 29 MAY 13
Applicable to: ALL

This table provides Guidance Modes that may be used depending on the Approach Types.

	Guidance Modes per Approach Types				
	LOC G/S	**FINAL APP**	**LOC FPA**	**NAV FPA**	**TRK FPA**
ILS / MLS ◁ / GLS ◁	*Refer to APPR using LOC G/S*	N/A	N/A	N/A	N/A
LOC ONLY ILS G/S OUT	N/A	N/A	*Refer to APPR using FPA Guidance*	N/A	N/A

For Circling Approach, *Refer to Circling Approach*

FLYING REFERENCE

Ident.: PRO-NOR-SOP-18-A-00014488.0001001 / 29 MAY 13
Applicable to: ALL

Use the following recommended flying reference:
- In vertical managed modes: HDG-V/S reference associated with the FD crossbars
- In vertical selected modes: TRK-FPA reference associated with FPD.

STABILIZATION CRITERIA

Ident.: PRO-NOR-SOP-18-A-00014487.0001001 / 09 FEB 18
Applicable to: MSN 01920, 02108, 02135, 02139-02359, 02584, 03264, 03330, 05120, 05158

The stabilization height is defined as one of the following:
- 1 000 ft above airfield elevation (AAL)in Instrument Meteorological Conditions (IMC), or
- 500 ft above airfield elevation (AAL) in Visual Meteorological Conditions (VMC), or
- Any other height defined in Operator policies or regulations.

In order for the approach to be stabilized, all of the following conditions must be satisfied before, or at the stabilization height:
- The aircraft is on the correct lateral and vertical flight path
- The aircraft is in the desired landing configuration

- The thrust is stabilized, usually above idle, and the aircraft is at target speed for approach

  Note: *In IMC, a later speed and thrust stabilization can be acceptable provided that:*
  - *It is in accordance with Operator policies and regulations*
  - *The aircraft is in deceleration toward the target approach speed*
  - *The flight crew stabilizes speed and thrust as soon as possible and not later than 500 ft AAL.*

- The flight crew does not detect any excessive flight parameter deviation.

If one of the above-mentioned conditions is not satisfied, the flight crew must initiate a go-around, unless they estimate that only small corrections are required to recover stabilized approach conditions.

STABILIZATION CRITERIA

Ident.: PRO-NOR-SOP-18-A-00014487.0002001 / 09 FEB 18

1 **Applicable to: MSN 01767, 01957-02097, 02121, 02138, 02388-02482, 02609-03138, 03308, 03357-05094, 05155, 05190-09063**

The stabilization height is defined as one of the following:
- 1 000 ft above airfield elevation (AAL)in Instrument Meteorological Conditions (IMC), or
- 500 ft above airfield elevation (AAL) in Visual Meteorological Conditions (VMC), or
- Any other height defined in Operator policies or regulations.

In order for the approach to be stabilized, all of the following conditions must be satisfied before, or at the stabilization height:
- The aircraft is on the correct lateral and vertical flight path
- The aircraft is in the desired landing configuration
- The thrust is stabilized, usually above idle, and the aircraft is at target speed for approach

  Note: *In IMC, a later speed and thrust stabilization can be acceptable provided that:*
  - *It is in accordance with Operator policies and regulations*
  - *The aircraft is in deceleration toward the target approach speed*
  - *The flight crew stabilizes speed and thrust as soon as possible and not later than 500 ft AAL.*

- The flight crew does not detect any excessive flight parameter deviation.

If one of the above-mentioned conditions is not satisfied, the flight crew must initiate a go-around, unless they estimate that only small corrections are required to recover stabilized approach conditions.

Note: *If the predicted tailwind at landing is greater than 10 kt, decelerated approach is not permitted, and the aircraft speed should be stabilized at around VREF + 5 kt in final.*

APPROACH SPEED TECHNIQUE

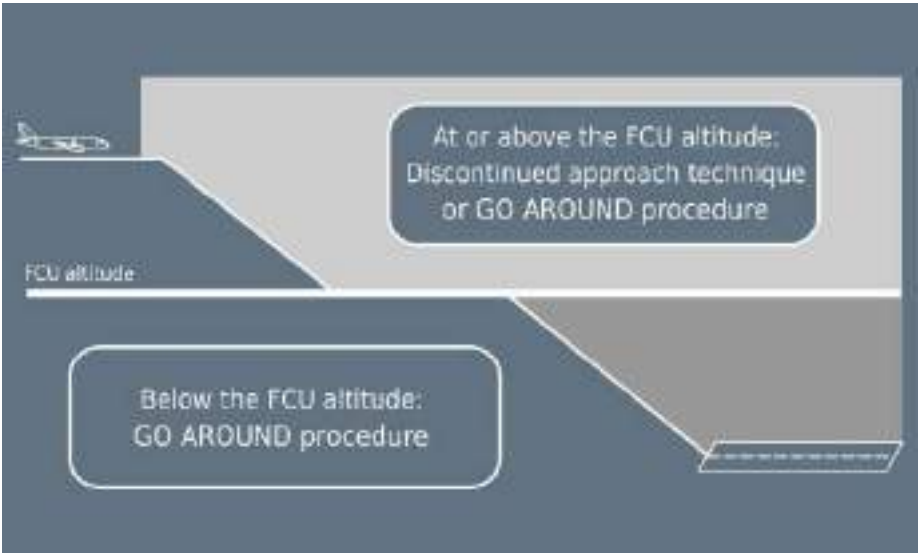
Ident.: PRO-NOR-SOP-18-A-00014485.0001001 / 29 MAY 13
Applicable to: ALL

DECELERATED APPROACH

The decelerated approach with FD or AP/FD guidance is the standard flying technique for ILS / MLS ◁ / GLS ◁ approaches and approaches using FLS ◁ or FINAL APP guidance.

EARLY STABILIZED APPROACH

Under certain circumstances, the flight crew may decide to reduce the speed down to VAPP in the landing configuration at the Final Descent Point (i.e. approach via selected guidance, high glide path angle, low altitude intermediate approach, etc.). In order to obtain a valuable deceleration pseudo waypoint and to ensure a timely deceleration, the flight crew should enter VAPP as a speed constraint at the Final Descent Point.



DISCONTINUED APPROACH

Ident.: PRO-NOR-SOP-18-A-00015226.0001001 / 03 DEC 13
Applicable to: ALL

In order to discontinue an approach when the aircraft is at or above the altitude selected on the FCU, the flight crew can either:

- Apply the GO AROUND procedure, or
- Apply the discontinued approach technique.

When the aircraft is below the FCU altitude, the flight crew must apply the GO AROUND procedure.

- **If at or above the FCU altitude:**
  Announce "CANCEL APPROACH".
  To disarm any AP/FD approach mode, press APPR pb or LOC pb.

  Note: *Valid only for ILS / MLS ◁ / GLS ◁ / FLS ◁ or FINAL APP guidance.*

  Select lateral mode as required (NAV or HDG mode).
  Select vertical mode as required (level off or adjust V/S).
  Select SPEED and adjust.

- **If F-PLN has no destination anymore:**
  Perform a LAT REV at the last waypoint and redefine the destination in the NEW DEST field.

Note: *1. The FMS does not automatically string the previous flown approach in the active F-PLN when the aircraft overflies the last waypoint. The FMS has no more destination in the F-PLN.*
2. Because the thrust levers are not set to TOGA detent, the FMS remains in approach phase.

Intentionally left blank

Aircraft Configuration Management

INITIAL APPROACH

Ident.: PRO-NOR-SOP-18-B-A-00014494.0001001 / 29 MAY 13
Applicable to: ALL

GENERAL

The initial approach procedure described here is a general guidance whatever the type of approach expected.

Ident.: PRO-NOR-SOP-18-B-A-00014493.0001001 / 03 MAR 14
Applicable to: ALL

INITIAL APPROACH

F-PLN SEQUENCING.....ADJUST

- *The NAV mode will be available after GO AROUND if the F-PLN is properly sequenced. A good cue to monitor the proper F-PLN sequencing is the TO waypoint on the upper right side of the ND, which should remain meaningful.*
- *In NAV mode, the F-PLN will sequence automatically.*
- *In HDG/TRK mode, the F-PLN will sequence automatically only if the aircraft flies close to the F-PLN route.*

APPROACH PHASE.....CHECK/ACTIVATE

- *If the aircraft overflies the DECEL pseudo waypoint in NAV mode, the APPR phase activates automatically.*
- *If the aircraft is in HDG/TRK mode, approximately 15 NM from touchdown, activate and confirm APPROACH phase on the MCDU (PERF DES page).*

MANAGED SPEED..... CHECK

- *If ATC requires a particular speed, use selected speed. When the ATC speed constraint no longer applies, return to managed speed.*

FLIGHT PATH.....MONITOR

- *In NAV mode, use VDEV information on the PFD and PROG page.*
- *In HDG/TRK mode, use the energy circle on ND representing the required distance to land.*

SPEED BRAKES lever.....AS RQRD

- *If the flight crew uses the speed brakes to increase the rate of deceleration or to increase the rate of descent, the VLS will increase as well:*
  - *The flight crew should ensure that appropriate speed margin exists before the extension of the speed brakes*
  - *If the speed brakes are extended, the flight crew should ensure that appropriate speed margin exists before the beginning of a turn.*

  This will avoid the activation of the Alpha-Floor protection.

  Note: In clean configuration, the VLS with speed brakes fully extended may be higher than green dot speed or VFE FLAP 1.

Ident.: TDU / PRO-NOR-SOP-18-B-A-00014648.0002001 / 23 JUN 15
Applicable to: MSN 02737, 03308, 03750
Impacted DU: 00014647 Initial Approach - Radar

RADAR

RADAR.....ADJUST AS APPROPRIATE

- *Gain must be manually set to +8 when MULTISCAN selector is set to AUTO and when flying below FL 150.*
- *MULTISCAN AUTO mode provides an efficient ground clutter rejection. During operations in good or non significant weather conditions, no weather pattern will be displayed on the NDs. In this case, the flight crew confirms correct radar operation, using temporarily MANUAL TILT.*
- *The flight crew monitors the weather radar display in AUTO mode, and confirms any weather display that is ambiguous or unexpected using manual tilt according to standard techniques.*

Ident.: TDU / PRO-NOR-SOP-18-B-A-00014648.0003001 / 03 MAR 14
Applicable to: MSN 02334, 03071, 03782, 04294, 04328, 04433-04438, 04488, 04506-04518, 04535, 04630, 05190, 05230-05259, 05313-05460, 05476, 05537-05577, 05683, 05727, 05829-05923, 06036-06336
Impacted DU: 00014647 Initial Approach - Radar

RADAR

RADAR.....ADJUST AS APPROPRIATE

- *Gain must be manually set to +4 when MULTISCAN selector is set to AUTO and when flying below FL 200.*
- *If the weather is good, or not significant, in order to check that the radar is operating correctly: down tilt under displaying ground echoes.*
- *If the weather display is ambiguous or unexpected, in order to better analyze the weather situation, use manual tilt according to standard technique.*

- *In particular below FL 200, for situations with low level weather, weather with low reflectivity or in front of suspected active cells, the flight crew should switch to manual mode and adjust the tilt setting downward until the weather is detected or the ground clutter appears on the upper part of the display.*
- *In addition, the flight crew may increase the manual gain control to display lower reflectivity targets. The manual gain control can be increased in both AUTO and manual modes to display lower levels of weather. In both cases, ground clutter may also be displayed as a result of low settings and/or increased gain.*

NAVIGATION ACCURACY

NAV ACCURACY.....MONITOR

- *When GPS PRIMARY is available, no NAV ACCURACY monitoring is required.*
- *If GPS PRIMARY is lost, or GPS not installed, check on PROG page that the required navigation accuracy is appropriate to the phase of flight.*
- *If NAV ACCURACY is LOW, at least one ND must be in ROSE LS/VOR depending on the approach.*

INTERMEDIATE/FINAL APPROACH

Ident.: PRO-NOR-SOP-18-B-B-00014501.0001001 / 29 MAY 13
Applicable to: ALL

GENERAL

The intermediate and final approach procedure described here is general guidance whatever the type of approach expected.

Ident.: PRO-NOR-SOP-18-B-B-00014500.0001001 / 17 MAR 17

1 **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

AT GREEN DOT SPEED

CAUTION	The flight crew should avoid extended flight in icing conditions with the slats extended.

FLAPS 1..... ORDER
FLAPS 1.....SELECT

- *FLAPS 1 should be selected more than 3 NM before the Final Descent Point.*
- *Check deceleration toward "S" speed.*
- *For decelerated approaches, the aircraft must reach or be established on the final descent with FLAPS 1 and "S" speed at or above 2 000 ft AGL.*
- *If the aircraft does not decelerate on the flight path or aircraft speed is significantly higher than "S" speed, extend the landing gear in order to slow down. The use of speedbrakes is possible. The flight crew should be aware that the use of speedbrakes causes an increase in VLS.*

TCAS Mode selector.....TA or TA/RA

- *FAA recommends to select TA only mode:*
  - *In case of known nearby traffic which is in visual contact*
  - *At particular airports and during particular procedures identified by an Operator as having a significant potential for unwanted or inappropriate resolution advisories (closely spaced parallel runways, converging runway, low terrain along the final approach, etc.).*

Ident.: PRO-NOR-SOP-18-B-B-00014500.0002001 / 17 MAR 17

2 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

AT GREEN DOT SPEED

CAUTION	The flight crew should avoid extended flight in icing conditions with the slats extended.

FLAPS 1..... ORDER
FLAPS 1.....SELECT

- *At high weights, if the green dot speed is close to VFE NEXT, the flight crew may select a lower speed.*
- *FLAPS 1 should be selected more than 3 NM before the Final Descent Point.*
- *Check deceleration toward "S" speed.*

- *For decelerated approaches, the aircraft must reach or be established on the final descent with FLAPS 1 and "S" speed at or above 2 000 ft AGL.*
- *If the aircraft does not decelerate on the flight path or aircraft speed is significantly higher than "S" speed, extend the landing gear in order to slow down. The use of speedbrakes is possible. The flight crew should be aware that the use of speedbrakes causes an increase in VLS.*

TCAS Mode selector.....TA or TA/RA

- *FAA recommends to select TA only mode:*
  - *In case of known nearby traffic which is in visual contact*
  - *At particular airports and during particular procedures identified by an Operator as having a significant potential for unwanted or inappropriate resolution advisories (closely spaced parallel runways, converging runway, low terrain along the final approach, etc.).*

Applicable to: ALL

AT 2 000 FT AGL MINIMUM

FLAPS 2..... ORDER
FLAPS 2.....SELECT

- *Check deceleration toward "F" speed.*
- *For ILS / MLS ◁ / GLS ◁ and approaches using FLS ◁, if the aircraft intercepts the flight path below 2 000 ft AGL, select FLAPS 2 at one dot below the flight path.*
- *If the aircraft speed is significantly higher than "F" speed on the flight path, or the aircraft does not decelerate on the flight path, extend the landing gear in order to slow down the aircraft. The use of speed brakes is not recommended.*
- *When the speed brakes are deployed, extending the flaps beyond FLAPS 1 may induce a slight roll movement, and in calm conditions a small lateral control asymmetry may remain until disturbed by a control input or by an atmospheric disturbance.*

  - *Take immediate corrective action to control the exceeded parameter back into the defined stabilized conditions*
  - *Assess whether stabilized conditions will be recovered early enough prior to landing, otherwise initiate a go-around.*

Applicable to: ALL

PATTERN (DECELERATED)

Aircraft Guidance Management

APPROACH USING LOC G/S GUIDANCE

Applicable to: ALL

Ident.: PRO-NOR-SOP-18-C-A-00014508.0001001 / 29 MAY 13

GENERAL

The following items are to be performed in addition to previous SOP chapters for ILS / MLS ◁ / GLS ◁ approach.

Ident.: PRO-NOR-SOP-18-C-A-00020896.0001001 / 20 MAR 17

DESCENT PREPARATION

APPROACH MINIMUM.....DETERMINE

- *For CATII, CATIII approaches, always choose the lowest achievable minimum. The approach minimum is limited by:*
  - *Crew qualification*
  - *Airline Operating Manual requirement*
  - *Aircraft technical status*
  - *Airport status*
- *For CATIII with no DH, the flight crew should enter "NO" in the DH field of the MCDU to avoid false "HUNDRED ABOVE" or "MINIMUM" auto callouts which would not be applicable.*

APPROACH BRIEFING.....PERFORM

For CATII, CATIII approaches, review the following items on top of the usual briefing:

- *Task sharing and callouts*
- *Management of degraded guidance*
- *Low visibility procedures at the airport*

Ident.: PRO-NOR-SOP-18-C-A-00014509.0001001 / 09 FEB 16

INITIAL/INTERMEDIATE APPROACH

APPR pb on FCU..... PRESS

- *Press the APPR pb when:*
  - *Cleared for the approach*
  - *On the intercept trajectory for the final approach course*
  - *LOC deviation is available.*

  This arms the LOC and G/S modes.

  Note: In NAV mode, the aircraft may leave the F-PLN to capture the LOC.
- *LOC and/or G/S capture modes will engage no sooner than 3 s after being armed.*
- *ICAO defines the envelope where the quality of the G/S signal ensures a normal capture. This envelope is within 10 NM, ±8 ° of the centerline of the ILS glide path and up to 1.75 θ and down to 0.3 θ (θ = nominal glide path angle). When arming the approach well outside of the normal G/S capture envelope, a spurious G/S* engagement may occur due to a wrong G/S deviation signal. Whenever the pilot notices the pitch movement, or the spurious G/S*, or the trajectory deviation, he will immediately disconnect the AP, if engaged, to re-establish a normal attitude and will disengage APPR mode. It is then recommended to arm/rearm APPR (ILS) mode within the normal capture zone.*

BOTH APs..... ENGAGE

- *When APPR mode is selected, AP1 and AP2 should be engaged.*
- *Above 5 000 ft AGL, the FMA displays CAT 1.*
- *Below 5 000 ft AGL, the FMA displays the correct approach capability for the intended approach.*

LOC..... CHECK ARMED
G/S..... CHECK ARMED
LOC CAPTURE.....MONITOR
G/S CAPTURE.....MONITOR
GO AROUND ALTITUDE..... SET

Ident.: PRO-NOR-SOP-18-C-A-00014510.0002001 / 03 MAR 14

GLIDE INTERCEPTION FROM ABOVE

The following procedure should only be applied when established on the localizer. The flight crew must react without delay to meet the stabilization criteria.

In order to get the best rate of descent when cleared by ATC and below the limiting speeds, the flight crew should lower the landing gear and select flaps as required (at least CONF 2 should be selected to ensure that the aircraft speed will not increase).

- **If above the glideslope:**
  APPR mode ..... ARM / CHECK ARMED
  FCU ALTITUDE..... SET ABOVE A/C ALTITUDE
  V/S MODE..... SELECT

  - *Select V/S 1 500 ft/min initially. V/S in excess of 2 000 ft/min will result in the speed increasing towards VFE.*
  - *When reaching VFE, the AP maintains VFE and reduces the V/S without MODE REVERSION.*

Ident.: PRO-NOR-SOP-18-C-A-00014511.0001001 / 04 JUL 17

FINAL APPROACH

FLIGHT PARAMETERS.....MONITOR

- *The PM calls out if excessive deviation occurs:*
  - *LOC: ½ dot*
  - *GLIDE: ½ dot*

  Refer to PRO-NOR-SOP-90 Approach

AT 350 ft RA

LAND mode..... CHECK ENGAGED/ANNOUNCE

If no LAND mode, autoland is not authorized.

FOR CAT I, CAT II, CAT III WITH DH APPROACH

AT ENTERED MINIMUM +100 ft

ONE HUNDRED ABOVE.....MONITOR OR ANNOUNCE

AT ENTERED MINIMUM

MINIMUM.....MONITOR OR ANNOUNCE

Below minimum, the visual references must be the primary reference until landing.
For more information regarding transition to visual references, *Refer to FCTM/PR-NP-SOP-250 Transition to Visual References*.

- **If visual references are sufficient:**
  CONTINUE.....ANNOUNCE
  AP.....AS RQRD

  For Minimum Use Height of the AP Refer to LIM-AFS-10 Flight Management Function

For Manual Landing and Autoland procedure *Refer to PRO-NOR-SOP-19 Landing - Flare*

■ **If visual references are not sufficient:**
GO AROUND..... ANNOUNCE
Initiate a go around.

FOR CAT III WITHOUT DH APPROACH

At 100 ft (Alert Height) if no failure

CONTINUE..... ANNOUNCE

Ident.: PRO-NOR-SOP-18-C-A-00021062.0002001 / 31 AUG 17

MANAGEMENT OF DEGRADED GUIDANCE

EARLY/UNTIMELY FLARE MODE ENGAGEMENT

- Perform a go around (thrust levers set to TOGA), or
- Disconnect AP, set both FDs to OFF and continue the approach using raw data or external visual references.

In association to an early/untimely FLARE mode engagement on the FMA, the following effects may occur:

- On the Primary Flight Display (PFD):
  - The RA height indication may be frozen at a positive or negative value,
  - Discrepancies between both PFDs may happen on the following indications:
    - RA heights,
    - FD orders,
    - FMA indications when both APs are engaged.
- Warnings and/or Callouts:
  - Untimely activation of the AUTOLAND warning light. *Refer to DSC-22_30-30 Autoland Warning*,
  - Untimely Terrain Awareness and Warning System (TAWS) alerts,
  - Untimely or absence of “RETARD" callout,
  - Untimely L/G GEAR NOT DOWN ECAM warning,
  - Absence or interruption of RA automatic callout (height announcement),
- On the System Display (SD): A pulsing cabin differential pressure advisory may appear on the ECAM - CAB PRESS PAGE

Note: *This ECAM advisory has no consequence on the real cabin pressure.*

FOR CAT II, CAT III OPERATIONS

- **In the case of:**

  - Amber caution (single chime), or
  - Landing capability degradation.

  Above 1000 ft:

  ECAM / QRH PROCEDURE..... COMPLETE
  REQUIRED EQUIPMENT..... CHECK

  Refer to QRH/OPS Required Equipment for CAT2 and CAT3

  APPROACH AND LANDING CAPABILITY..... CHECK

  If required:

  RVR..... CHECK
  DH..... ADJUST
  BRIEFING..... CONFIRM

  - **If the flight crew does not complete all the above actions at 1 000 ft:**
    GO AROUND..... PERFORM

  Below 1000 ft:

  - **If external visual references are not sufficient:**
    GO AROUND..... PERFORM

  Below 100 ft (Alert Height) for CAT 3 DUAL:

  Approach may be continued unless autoland light comes on.

- **In the case of Autoland warning light:**

  - **Visual references not sufficient:**
    GO AROUND..... PERFORM

  - **Visual references sufficient:**

    Approach may be continued manually

APPROACH USING FINAL APP GUIDANCE

Ident.: PRO-NOR-SOP-18-C-C-00014521.0002001 / 29 MAY 13
Applicable to: ALL

GENERAL

The following items are to be performed in addition to previous SOP chapters in the following cases:

- RNAV(GNSS) approaches with LNAV and LNAV/VNAV minima
- Conventional approaches based on VOR or NDB using FINAL APP guidance.

Ident.: PRO-NOR-SOP-18-C-C-00014522.0003001 / 09 SEP 14
Applicable to: ALL

AIRCRAFT EQUIPMENT

For RNAV(GNSS) approaches, *Refer to PRO-SPO-51 RNP APCH / RNAV(GNSS) - Required RNP APCH Equipment*

Ident.: PRO-NOR-SOP-18-C-C-00015860.0001001 / 09 SEP 14
Applicable to: ALL

FLIGHT PREPARATION

For RNAV(GNSS) approaches, GPS PRIMARY availability should be confirmed.
Refer to PRO-NOR-SOP-02 GPS PRIMARY Availability (If Installed)

Ident.: PRO-NOR-SOP-18-C-C-00014524.0002001 / 08 AUG 17
Applicable to: ALL

DESCENT PREPARATION

WEATHER AND LANDING INFORMATION.....OBTAIN

- *The FMS vertical profile does not take into account the effect of low OAT. Therefore, vertical managed guidance:*
  - *Must not be used when the actual OAT is below the minimum temperature indicated on the approach chart or defined by the Operator, or*
  - *May not be used when temperature corrections are required (FINAL APP mode may not engage).*
- *For RNAV (GNSS) approach with LNAV VNAV minima, use of QNH from a remote station is prohibited.*

F-PLN A page..... CHECK

- *If a TOO STEEP PATH is displayed after the Final Descent Point (FDP), do not use FINAL APP guidance for approach. Use NAV FPA, TRK FPA or FLS ◁ for approach.*
- *0.1 degree of difference between the MCDU and the charted final vertical path is acceptable*
- *1 degree of difference between the MCDU and the charted final lateral track is acceptable*

  Note: *A higher lateral track value can be acceptable if the navigation database has been validated to exclude potential coding error.*

- *3 degree of difference between the MCDU and the charted final lateral track is acceptable for conventional radio NAVAID approach.*

PROG page.....COMPLETE

- *Insert the reference RWY threshold in the BRG/DIST field for position monitoring during approach.*

GO AROUND STRATEGY..... REVIEW

- *The briefing should include a review of the "Management of Degraded Navigation" chapter.*

Ident.: PRO-NOR-SOP-18-C-C-00014525.0003001 / 23 JUN 15
Applicable to: ALL

DESCENT

At 10 000 ft:

NAV ACCURACY.....CHECK

- *If NAV accuracy is LOW, use TRK FPA mode for approach (Refer to APPR using FPA guidance).*

● **For RNAV(GNSS) approach:**
GPS PRIMARY.....CHECK

- *GPS PRIMARY must be available on at least 1 FMS.*

BARO REF.....SET

- *The vertical guidance requires a precise baro setting. The maximum acceptable discrepancy between altimeters is 100 ft.*

Ident.: PRO-NOR-SOP-18-C-C-00014526.0002001 / 08 AUG 17
Applicable to: ALL

INITIAL/INTERMEDIATE/FINAL APPROACH

POSITION..... MONITOR

- *Check that ATC clearances allow the aircraft to fly through the capture area of vertical profile. After a radar vectoring, consider a DIR TO RDL IN to sequence the F-PLN.*

APPR pb on FCU..... PRESS

Press the APPR pb when all of the following conditions are satisfied:
- *The aircraft is cleared for approach*
- *TO waypoint is the Final Descent Point.*

APP NAV..... CHECK ARMED or ENGAGED
FINAL..... CHECK ARMED

- *Check that the V/DEV scale is displayed on the PFD.*
- *At the Final Descent Point, a blue arrow on ND indicates that FINAL APP engagement conditions are met.*

At the Final Descent Point:

FINAL APP..... CHECK ENGAGED
GO AROUND ALTITUDE..... SET
FLIGHT PARAMETERS..... MONITOR

- *Monitor XTK error on ND.*
- *Monitor V/DEV on PFD.*
- *Crosscheck distances versus altitudes as published on the charts.*
- *If approaching on a conventional radio NAVAID procedure, monitor the lateral and vertical guidance using raw data.*
- *The PM calls out if excessive deviation occurs:*
  - *XTK > 0.1 NM*
  - *V/DEV > ½ dot*

L2 *On the vertical scale, one dot corresponds to 100 ft. Thus ½ dot is 50 ft.*

L1 *Refer to PRO-NOR-SOP-90 Approach*

MANAGEMENT OF DEGRADED NAVIGATION

- **For VOR and NDB approaches, be prepared to continue the approach with reference to appropriate raw data by reverting to:**
  - NAV FPA, if the vertical guidance is not satisfactory
  - TRK FPA, if the lateral guidance is not satisfactory.
- **For RNAV(GNSS) approaches with LNAV minima and LNAV/VNAV minima:**
  - Use the appropriate remaining AP/FDin the following cases:
    - GPS PRIMARY LOST on one ND
    - NAV ACCUR DOWNGRAD on one FMGS.
  - Discontinue the approach in the following cases, if external visual references are not sufficient to proceed visually:
    - GPS PRIMARY LOST on both NDs
    - XTK > 0.3 NM
    - NAV FM/GPS POS DISAGREE on ECAM
    - NAV ACCUR DOWNGRAD on both FMGS.
- **For RNAV(GNSS) approaches with LNAV/VNAV minima:**
  - Discontinue the approach in the case of deviation of 75 ft below the vertical path (V/DEV>¾ dot).

APPROACH USING FPA GUIDANCE

Ident.: PRO-NOR-SOP-18-C-E-00014561.0002001 / 29 MAY 13
Applicable to: ALL

GENERAL

The following items are to be performed in addition to previous SOP chapters in the following cases:
- RNAV(GNSS) approaches using mixed NAV FPA guidance with LNAV minima only
- Conventional approaches based on VOR and NDB using selected TRK FPA or mixed NAV FPA guidance
- ILS G/S OUT, LOC ONLY and back course localizer approaches.

The approach is flown in TRK FPA when:
- The approach is not stored in the database or
- NAV accuracy is LOW.

Ident.: PRO-NOR-SOP-18-C-E-00014560.0003001 / 09 SEP 14
Applicable to: ALL

AIRCRAFT EQUIPMENT

For RNAV(GNSS) approaches, *Refer to PRO-SPO-51 RNP APCH / RNAV(GNSS) - Required RNP APCH Equipment*

Ident.: PRO-NOR-SOP-18-C-E-00015861.0001001 / 09 SEP 14
Applicable to: ALL

FLIGHT PREPARATION

For RNAV(GNSS) approaches, GPS PRIMARY availability should be confirmed.
Refer to PRO-NOR-SOP-02 GPS PRIMARY Availability (If Installed)

NAV ACCURACY..... CHECK

- *If NAV accuracy is LOW, use TRK mode for approach.*

- **For RNAV(GNSS) approach:**
  GPS PRIMARY.....CHECK

  - *GPS PRIMARY must be available on at least 1 FMS.*

Ident.: PRO-NOR-SOP-18-C-E-00014556.0002001 / 21 MAR 17
Applicable to: ALL

INITIAL/INTERMEDIATE/FINAL APPROACH

LATERAL GUIDANCE MODE.....SET FOR APPROACH

- *Arm NAV or LOC mode as appropriate.*

- **For LOC ONLY and ILS G/S OUT:**
  LOC pb-sw.....PRESS

  - *Press the LOC pb-sw when cleared for approach and on the intercept trajectory for the final approach course.*

    Note: In NAV mode, the aircraft may leave the F-PLN to capture the LOC.

  LOC.....CHECK ARMED

CAUTION	Do not press the APPR pb

- **For back course localizer approaches:**
  TRK FPA MODE.....USE FOR APPROACH

  - *Refer to FCTM/PR-NP-SOP-190-GUI Back Course Localizer Approach.*

LATERAL PATH.....INTERCEPT

- *Monitor NAV or LOC engagement as appropriate.*

TRK FPA pb (Bird).....SELECT
FPA FOR FINAL APPROACH.....SET

At 0.3 nm from the Final Descent Point:

FPA selector.....PULL
FPA MODE.....CHECK ENGAGED

- *Check NAV FPA, TRK FPA or LOC FPA is engaged.*

POSITION/FLIGHT PATH.....MONITOR/ADJUST
GO AROUND ALTITUDE.....SET

- *Set when below the go around altitude to avoid unexpected altitude capture.*

FLIGHT PARAMETERS.....MONITOR

- *Crosscheck distances versus altitudes as published on the charts.*
- *If approaching on a conventional radio NAVAID procedure, monitor the lateral and vertical guidance using raw data.*
- *For approaches using NAV FPA, monitor XTK error on ND to check the lateral guidance.*
- *The PM calls out if excessive lateral deviation occurs:*
  - *Approach using NAV MODE: XTK > 0.1 NM*
  - *Approach using LOC MODE: LOC ½ dot*
  - *Approach using TRK MODE:*
    - *VOR: ½ dot or 2.5 °*
    - *NDB: 5 °*

Refer to PRO-NOR-SOP-90 Flight Parameters in Approach

MANAGEMENT OF DEGRADED NAVIGATION

● **For VOR and NDB approaches in NAV FPA, if lateral guidance is not satisfactory:**

- Be prepared to continue the approach with reference to appropriate raw data by reverting to TRK FPA.

- **For RNAV(GNSS) approaches, with LNAV minima:**
  - Use the appropriate remaining AP FD in the following cases:
    - GPS PRIMARY LOST on one ND
    - NAV ACCUR DOWNGRAD on one FMGS
  - Discontinue the approach in the following cases, if external visual references are not sufficient to proceed visually:
    - GPS PRIMARY LOST on both NDs
    - XTK > 0.3 NM
    - NAV FM/GPS POS DISAGREE on ECAM
    - NAV ACCUR DOWNGRAD on both FMGS

CIRCLING APPROACH

Applicable to: ALL

Ident.: PRO-NOR-SOP-18-C-F-00014570.0001001 / 29 MAY 13

GENERAL

The circling approach is the visual phase of an instrument approach to bring an aircraft into position for landing on a runway which is not suitably located for a straight-in approach.

CAUTION	The flight crew must conduct the flight within the circling area, while maintaining required visual references at all times.

Ident.: PRO-NOR-SOP-18-C-F-00014569.0001001 / 29 MAY 13

APPROACH PREPARATION

For a circling approach, the approach preparation should include the following additional items in the FMS programming.

F-PLN

Introduce the instrument approach procedure, including the missed approach procedure for instrument approach.

SEC F-PLN

The landing runway must be inserted into the SEC F-PLN.

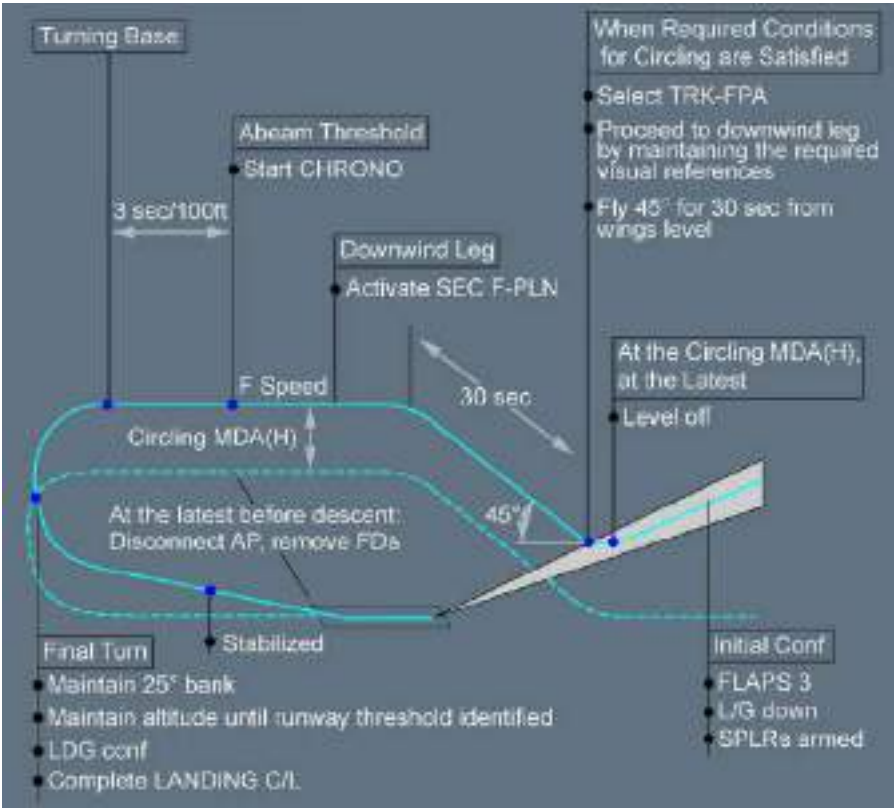
Update the SEC F-PLN as follows:
- Copy the active F-PLN
- Revise the landing runway.

Ident.: PRO-NOR-SOP-18-C-F-00014568.0001001 / 29 MAY 13

INSTRUMENT APPROACH

The flight crew flies a stabilized approach at "F" speed, configuration 3 and landing gear down.

Ident.: PRO-NOR-SOP-18-C-F-00014567.0001001 / 29 MAY 13



CIRCLING APPROACH

- **At the Circling MDA(H) at the latest:**
  Perform a level off
- **At MAP, if the flight crew finds no visual reference:**
  Initiate a go around
- **When required conditions for circling are satisfied:**
  Select TRK FPA
  Proceed to downwind leg
  At any time in the downwind leg, activate the SEC F-PLN
  Disconnect the AP and remove the FDs at the latest before starting the descent toward the runway
  Set the landing configuration when appropriate, but ensure early stabilization in final.

If, at any time during the circling procedure, the required visual references are lost, initiate a go around following the missed approach of the initial instrument approach (unless otherwise specified).

Ident.: PRO-NOR-SOP-18-C-F-00014566.0001001 / 30 JUN 16

CIRCLING APPROACH PATTERN

RNAV VISUAL APPROACH

Applicable to: ALL

Ident.: PRO-NOR-SOP-18-C-G-00016048.0001001 / 23 DEC 14

GENERAL

The aircraft navigates using the RNAV system, but the position is monitored by visual reference to the ground, obstacles and other traffic.
RNAV visual approach must be stored and retrievable from the Navigation Database.

Ident.: PRO-NOR-SOP-18-C-G-00016049.0001001 / 23 DEC 14

EQUIPMENT REQUIRED

- 1 FMS
- 1 GPS or 2 DME to update FM position
- Additional requirement if indicated on the approach chart.

Ident.: PRO-NOR-SOP-18-C-G-00016050.0001001 / 17 MAR 17

FMGC GUIDANCE MODE

- **If no required accuracy is published:**

  The use of FMGC guidance mode is at flight crew discretion.

- **If RNAV 1 or RNP 1 is required on the published approach chart:**

  The flight crew should use adequate FMGC guidance modes.

Note: *The use of lateral and vertical managed guidance modes reduces the crew workload and improves energy management.*

For RNAV VISUAL approach including RF legs, *Refer to FCTM/PR-NP-SP-30 General* for RF leg flying technic.

Ident.: PRO-NOR-SOP-18-C-G-00016051.0001001 / 23 DEC 14

DESCENT PREPARATION

For approach data insertion in the FMS, keep the BARO/MDA field empty on the PERF APPR Page.

Ident.: PRO-NOR-SOP-18-C-G-00016052.0001001 / 23 DEC 14

DESCENT

For RNAV VISUAL approaches requiring GPS, check that GPS PRIMARY is available on at least 1 FMS.

Ident.: PRO-NOR-SOP-18-C-G-00016053.0001001 / 21 MAR 17

FINAL APPROACH

The flight crew must disconnect the AP at the latest at the Minimum Use Height of the AP.
Refer to LIM-AFS-10 Autopilot Function

VISUAL APPROACH

Ident.: PRO-NOR-SOP-18-C-H-00014574.0001001 / 29 MAY 13
Applicable to: MSN 01920, 02108, 02135, 02139-02359, 02584, 03264, 03330, 05120, 05158

GENERAL

Perform the approach on a nominal 3 ° glideslope using visual references. Approach to be stabilized by 500 ft AGL on the correct approach path, in the landing configuration, at VAPP.

Method:
- The AP is not used
- Both FDs are OFF
- FPV use is recommended
- A/THR use is recommended with managed speed.

Bear in mind the possible risk of optical illusions due to hindered night vision.

Ident.: PRO-NOR-SOP-18-C-H-00014574.0002001 / 29 MAY 13
3 **Applicable to: MSN 01767, 01957-02097, 02121, 02138, 02388-02482, 02609-03138, 03308, 03357-05094, 05155, 05190-09063**

GENERAL

Perform the approach on a nominal 3 ° glideslope using visual references. Approach to be stabilized by 500 ft AGL on the correct approach path, in the landing configuration, at VAPP.

Method:
- The AP is not used
- Both FDs are OFF
- FPV use is recommended
- A/THR use is recommended with managed speed.

Bear in mind the possible risk of optical illusions due to hindered night vision.

Note: *If the forecasted tailwind at landing is greater than 10 kt, decelerated approach is not allowed, and the speed should be stabilized around VREF + 5 kt in final.*

Ident.: PRO-NOR-SOP-18-C-H-00014573.0001001 / 08 AUG 13
Applicable to: ALL

INITIAL/INTERMEDIATE APPROACH

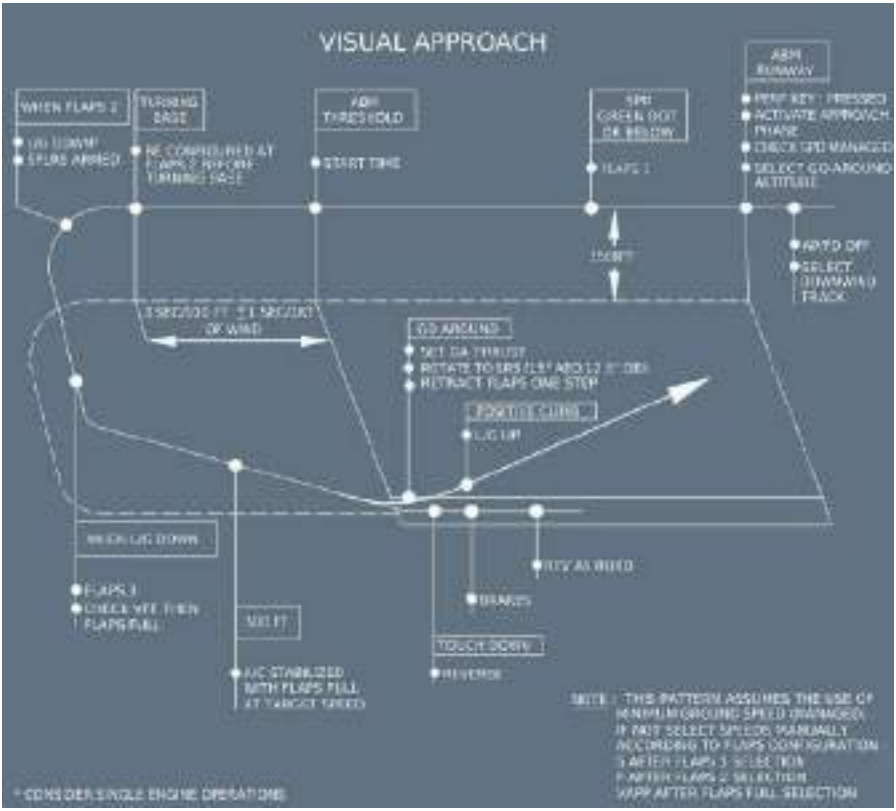
The flight plan selected on the MCDU should include the selection of the landing runway. The downwind leg may also be part of the flight plan. This may be a useful indication of the aircraft position in the circuit on the ND.
However, visual references must be used.
Therefore, at the beginning of the downwind leg:

Manually ACTIVATE APPR

Select FDs to OFF
Select TRK FPA to have FPV displayed
Check A/THR active.

Extend the downwind leg to 3 s/100 ft (± 1 s/1 kt of headwind / tailwind).
Turn into base leg with a maximum of 30 ° of bank. Descent with approximate FPA, in FLAPS 2, at F speed.

Ident.: PRO-NOR-SOP-18-C-H-00014572.0001001 / 29 MAY 13
Applicable to: ALL



FINAL APPROACH

The speed trend arrow and FPV help the flight crew make timely and correct thrust settings (if in manual thrust), and approach path corrections.

Avoid descending through the correct approach path with idle thrust. (Late recognition of this situation without a prompt thrust increase may lead to considerable speed decay and altitude loss).Ensure that the aircraft is stabilized on the final descent path at VAPP (or ground speed mini) in the landing configuration with the thrust stabilized (usually above idle) at 500 ft above airfield elevation or as restricted by Operator policies/regulations. If the aircraft is not stabilized, the flight crew must initiate a go around, unless they think that only small corrections are necessary to rectify minor deviations from stabilized conditions due, amongst others, to external perturbations.
Avoid any tendency to “duck under” in the late stages of the approach.
Avoid destabilizing the approach in the last 100 ft, in order to have the best chance of performing a good touchdown at the desired position.

Applicable to: MSN 03750, 04393

FLARE

The cockpit cut-off angle is 20 °.

- **In stabilized approach conditions, the flare height is approximately 30 ft:**
  FLARE..... PERFORM

  Avoid flaring high. Refer to Ground Clearance Diagram.

  ATTITUDE..... MONITOR
  THRUST levers..... IDLE

  If autothrust is engaged, it automatically disconnects when the pilot sets both thrust levers to the IDLE detent.
  In manual landing conditions, the "RETARD" callout is triggered at 20 ft radio height, in order to remind the pilot to retard the thrust levers.

  Note: *If one or both thrust levers remain above the IDLE detent, ground spoilers extension is inhibited.*

Ident.: PRO-NOR-SOP-19-A-00010351.0011001 / 25 APR 17
[1] **Applicable to: MSN 01767-03618, 03782-04384, 04394-09063**

FLARE

The cockpit cut-off angle is 20 °.

- **In stabilized approach conditions, the flare height is approximately 30 ft:**
  FLARE..... PERFORM

  Avoid flaring high. Refer to Ground Clearance Diagram.

  ATTITUDE..... MONITOR
  THRUST levers..... IDLE

  If autothrust is engaged, it automatically disconnects when the pilot sets both thrust levers to the IDLE detent.
  In manual landing conditions, the "RETARD" callout is triggered at 20 ft radio height, in order to remind the pilot to retard the thrust levers.

  Note: *The ground spoilers extension is inhibited if:*
  - *Both thrust levers remain above the idle detent, or*
  - *One thrust lever is above idle and one thrust lever is at idle detent.*

AT TOUCHDOWN

DEROTATION..... INITIATE

- *Lower the nosewheel without undue delay.*
- *The PM continues to monitor the attitude.*

ALL THRUST LEVERS..... REV MAX or REV IDLE

The flight crew must select reverse thrust immediately after main landing gear touchdown.

The flight crew must immediately select REV MAX, if any of the following occurs at any time during the landing:

- *An emergency*
- *The deceleration is not as expected*
- *A failure affects the landing performance*
- *A long flare or a long touchdown*
- *An unexpected tailwind.*

A small pitch up may occur during thrust reversers deployment before nose landing gear touchdown. However, the flight crew can easily control this pitch up.
As soon as the flight crew selects reverse thrust, they must perform a full-stop landing.

GROUND SPOILERS..... CHECK/ANNOUNCE

Check that the WHEEL SD page displays the ground spoilers extended after touchdown.

If no ground spoilers are extended:

- *Verify and confirm that both thrust levers are set to IDLE or REV detent.*
- *Set both thrust reverser levers to REV MAX, and fully press the brake pedals.*

Note: If ground spoilers are not armed, ground spoilers extend at reverser thrust selection.

REVERSERS..... CHECK/ANNOUNCE

Check that the ECAM E/WD displays that the reverse deployment is as expected (REV green).

DIRECTIONAL CONTROL.....MONITOR/ENSURE

- *Monitor directional control, if the rollout is automatic.*
- *Ensure directional control, if rollout is manual. Use rudder pedals for directional control.*
- *Do not use the nosewheel steering control handle before reaching taxi speed.*
- *During rollout, the flight crew should avoid sidestick inputs (either lateral or longitudinal).*
- *If directional control problems are encountered, the flight crew should reduce thrust to reverse idle until directional control is satisfactory.*

BRAKES..... AS RQRD

- *Monitor the autobrake, if it is ON. When required, brake with the pedals*
- *Although the green hydraulic system supplies the braking system, if pedals are pressed rapidly, a brake pressure indication appears briefly on the BRAKE PRESS indicator.*
- *Braking may begin before the nosewheel has touched down, if required for performance reasons. However, when comfort is the priority, the flight crew should delay braking until the nosewheel has touched down.*

Note: *If no ground spoilers are extended, the autobrake is not activated.*

DECELERATION..... CHECK/ANNOUNCE

The deceleration is felt by the flight crew, and confirmed by the speed trend on the PFD.

Applicable to: MSN 01767-01920, 02388, 02584, 02712, 03138, 03750, 04294, 04314, 04393-04438, 04510

CAUTION	In icing conditions (*Refer to LIM-ICE_RAIN Definition of Icing Conditions*), the flight crew must turn on the engine anti-ice and should not wait until seeing ice building up.

ANTI ICE..... AS RQRD

- *If engine anti-ice is used, take care to control taxi speed, especially on wet or slippery surfaces. (N1 ground idle is increased).*
- *During ground operation, when in icing conditions for more than 30 min, the following procedure should be applied for ice shedding:*

CAUTION	*If, during thrust increase, the aircraft starts to move, immediately retard the thrust levers to IDLE.*

If ground surface conditions and the environment permit, the flight crew should accelerate the engines to approximately 70 % of N1 for 30 s at intervals not greater than 30 min.
If ground surface or environment do not permit to accelerate the engine to 70 % N1, then power setting and dwell time should be as high as practical.
When operating in conditions of freezing rain, freezing drizzle, freezing fog or heavy snow, ice shedding may be enhanced, by additional run ups at intervals, to not exceed 10 min, advancing throttles to 70 % N1 momentarily (no hold time).

- *If engine anti-ice is used, take care to control taxi speed, especially on wet or slippery surfaces. (N1 ground idle is increased).*
- *During ground operation, when in icing conditions and the OAT is plus 3 °C or less, the following procedure should be applied for ice shedding:*

CAUTION	*If, during thrust increase, the aircraft starts to move, immediately retard the thrust levers to IDLE.*

If ground surface conditions and the environment permit, the flight crew should accelerate the engines to minimum 50 % of N1 at intervals not greater than 15 min. There is no requirement to maintain the high thrust settings.

Ident.: PRO-NOR-SOP-21-A-00011849.0003001 / 17 MAR 17

7 **Applicable to: MSN 06720-09063**

CAUTION	In icing conditions (*Refer to LIM-ICE_RAIN Definition of Icing Conditions*), the flight crew must turn on the engine anti-ice and should not wait until seeing ice building up.

ANTI ICE.....AS RQRD

- *If engine anti-ice is used, take care to control taxi speed, especially on wet or slippery surfaces. (N1 ground idle is increased).*
- *During ground operation, when in icing conditions and the OAT is plus 3 °C or less, the following procedure should be applied for ice shedding:*

CAUTION	*If, during thrust increase, the aircraft starts to move, immediately retard the thrust levers to IDLE.*

If ground surface conditions and the environment permit, the flight crew should accelerate the engines to minimum 60 % of N1 at intervals not greater than 30 min. There is no requirement to maintain the high thrust settings.

SECURING THE AIRCRAFT

Ident.: PRO-NOR-SOP-23-A-00010336.0001001 / 05 JUN 18
Applicable to: ALL

GENERAL

The flight crew should apply the following procedure as per company policy.
Airbus recommends performing the following procedure when the aircraft is left unattended: i.e. no qualified flight crew or ground crew are in the cockpit to supervise and monitor the aircraft systems.

Prior to performing this check, the following SUP Adverse Weather procedures should be taken into account when appropriate:

- Securing the aircraft for cold soak (*Refer to PRO-NOR-SUP-ADVWXR Securing the Aircraft for Cold Soak*).
- Water system draining (*Refer to PRO-NOR-SUP-ADVWXR For Draining Water Procedure - Introduction*).
- Ground operations in heavy rain (*Refer to PRO-NOR-SUP-ADVWXR Ground Operations in Heavy Rain*).
- Operations on contaminated airports (*Refer to PRO-NOR-SUP-ADVWXR Parking*).
- Operations with volcanic ash, sand or dust (*Refer to PRO-NOR-SUP-ADVWXR Securing the Aircraft*).

COMMUNICATIONS AND STANDARD TERMS

Ident.: PRO-NOR-SOP-90-00011900.0001001 / 13 AUG 10
Applicable to: ALL

Standard phraseology is essential to ensure effective crew communication. The phraseology should be concise and exact. The following Chapter lists the callouts that should be used as standard. They supplement the callouts identified in the SOP.
These standard Airbus callouts are also designed to promote situational awareness, and to ensure crew understanding of systems and their use in line operation.

CHECKLIST CALLOUTS

Ident.: PRO-NOR-SOP-90-00011901.0001001 / 20 DEC 10
Applicable to: ALL

- "CHECK": A command for the other pilot to check an item.
- "CHECKED": A response that an item has been checked.
- "CROSSCHECKED": A callout verifying information from both pilot stations.

If a checklist needs to be interrupted, announce: "HOLD CHECKLIST AT ___" and "RESUME CHECKLIST AT ___" for the continuation.
Upon completion of a checklist announce: "__CHECKLIST COMPLETE".

ACTIONS COMMANDED BY PF

Applicable to: ALL

Ident.: PRO-NOR-SOP-90-A-00011902.0001001 / 13 AUG 10

GENERAL

The following commands do not necessarily initiate a guidance mode change, eg.: selected to managed/managed to selected. The intent is to ensure clear, consistent, standard communication between crewmembers.
All actions performed on the FCU and MCDU must be checked on the PFD and ND (eg.: "FL 350 blue", "FL 200 magenta"). Ensure that the correct FCU knob is used, then verify indications on the PFD/ND.

Ident.: PRO-NOR-SOP-90-A-00011904.0001001 / 09 JUN 15

SET

The "SET" command means using an FCU knob to set a value, but not to change a mode.
SET is accomplished by only rotating the appropriate selection knob.

Example:
- "SET GO AROUND ALTITUDE__FT"
- "SET FL __"
- "SET HDG __"

Ident.: PRO-NOR-SOP-90-A-00011905.0001001 / 20 DEC 10

MANAGE/PULL

The "MANAGE" command means pushing an FCU knob to engage, or arm, a managed mode or target.

The "PULL" command means pulling an FCU knob to engage a selected mode or target. Example:
- "PULL HDG 090" (HDG/TRK knob is pulled and turned).
- "MANAGE NAV" (HDG/TRK knob is pushed).
- "FL 190 PULL" (ALT knob is turned and pulled).
- "FL 190 MANAGE" (ALT knob is turned and pushed).
- "PULL SPEED 250 KNOTS" (SPD/MACH knob is pulled and turned).
- "MANAGE SPEED" (SPD/MACH knob is pushed).

Note: If the value was previously set, there is no requirement to repeat the figure. Simply call e.g. PULL HDG: PULL SPEED: FL PULL.

The VS/FPA knob has no managed function. The standard callouts for the use of this knob are as follows:
V/S Plus (or Minus) 700 PULL, or

FPA Minus 3 ° PULL (V/S/FPA knob is turned and pulled)

PUSH TO LEVEL OFF (V/S/FPA knob is pushed)

Ident.: PRO-NOR-SOP-90-A-00011906.0001001 / 13 AUG 10

ARM

The "ARM __" command means arming a system by pushing the specified FCU button.
e.g. : "ARM APPROACH"
e.g. : "ARM LOC."

Ident.: PRO-NOR-SOP-90-A-00011907.0001001 / 13 AUG 10

ON/OFF

The simple ON or OFF command is used for the autopilot, flight directors, autothrust and the bird (flight path vector).
e.g.: BIRD ON (The HDG-V/S / TRK-FPA pb is pushed.)

FMA

Ident.: PRO-NOR-SOP-90-00011908.0001001 / 23 DEC 14
Applicable to: ALL

The PF should call out any FMA change, unless specified differently (e.g. CAT II & III task sharing). Therefore, the PF should announce:

- All armed modes with the associated color (e.g. blue, magenta): "G/S blue", "LOC blue".
- All active modes without the associated color (e.g. green, white): "NAV", "ALT".

The PM should check and respond, "CHECKED" to all FMA changes called out by the PF.

ALTITUDE

Ident.: PRO-NOR-SOP-90-00011909.0001001 / 23 DEC 14
Applicable to: ALL

The PM calls out "one thousand to go" when passing 1 000 ft before the cleared altitude or FL, and the PF calls out "checked".

FLAPS OR GEAR CALLOUTS

Applicable to: ALL

Ident.: PRO-NOR-SOP-90-B-00011910.0001001 / 23 DEC 14

FLAPS' CALLOUTS

FLAPS' CONFIGURATION	CALLOUT
1	"FLAPS ONE"
1 + F	"FLAPS ONE"
0	"FLAPS ZERO"

The reply will be given when selecting the new flap position.
e.g.:

	CALLOUT	REMARK
PF	"FLAPS ONE"	
PM	"SPEED CHECKED"	PM checks the speed: - Above the S or F speed and accelerating (Takeoff) - Below VFE next and decelerating (Approach)
	"FLAPS ONE"	PM selects the FLAPS lever position and replies after checking the blue number on the ECAM flaps indicator to confirm the correct selection has been made.

Ident.: PRO-NOR-SOP-90-B-00011911.0001001 / 23 DEC 14

GEAR CALLOUTS

	CALLOUT	REMARKS
PF	"GEAR UP (DOWN)"	
PM	"GEAR UP (DOWN)"	The PM selects the L/G lever position and replies after checking the red lights on the LDG GEAR indicator to confirm gear operation.

FLIGHT PARAMETERS

Ident.: PRO-NOR-SOP-90-C-00011912.0001001 / 22 MAR 17

[1] **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

APPROACH

During approach, the PM announces:
- "SPEED" if the speed decreases below the speed target -5 kt or increases above the speed target +10 kt.
- "SINK RATE" when the descent rate exceeds 1 000 ft/min
- "BANK" when bank angle becomes greater than 7 °
- "PITCH" when pitch attitude becomes lower than -2.5 ° or higher than +10 °
- "LOC" or "GLIDE" when either localizer or glide slope deviation is:
  - ½ dot LOC
  - ½ dot GS.
- "CROSS TRACK" when the XTK is greater than 0.1 NM
- "V/DEV" when the vertical deviation is greater than ½ dot
- "COURSE" when greater than ½ dot or 2.5 ° (VOR) or 5 ° (ADF).
- "__ FT HIGH (LOW)" at altitude checks points.

Note: The PM announces the attitude deviations until landing.

Ident.: PRO-NOR-SOP-90-C-00011912.0002001 / 22 MAR 17

[2] **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

APPROACH

During approach, the PM announces:
- "SPEED" if the speed decreases below the speed target -5 kt or increases above the speed target +10 kt
- "SINK RATE" when the descent rate exceeds 1 000 ft/min
- "BANK" when bank angle becomes greater than 7 °
- "PITCH" when pitch attitude becomes lower than -2.5 ° or higher than +7.5 °

- "LOC" or "GLIDE" when either localizer or glide slope deviation is:
  - ½ dot LOC
  - ½ dot GS.
- "CROSS TRACK" when the XTK is greater than 0.1 NM
- "V/DEV" when the vertical deviation is greater than ½ dot
- "COURSE" when greater than ½ dot or 2.5 ° (VOR) or 5 ° (ADF)
- "__ FT HIGH (LOW)" at altitude checks points.

Note: The PM announces the attitude deviations until landing.

Ident.: PRO-NOR-SOP-90-C-00021570.0004001 / 22 MAR 17

[3] **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

LANDING

During landing, the PM announces:
- "PITCH PITCH", if the pitch attitude approaches the tail strike pitch limit indicator ◁, or reaches 7.5 °
- "BANK BANK", if the bank angle reaches 7 °.

Ident.: PRO-NOR-SOP-90-C-00021570.0001001 / 22 MAR 17

[4] **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

LANDING

During landing, the PM announces:
- "PITCH PITCH", if the pitch attitude approaches the tail strike pitch limit indicator ◁, or reaches 10 °
- "BANK BANK", if the bank angle reaches 7 °.

Ident.: PRO-NOR-SOP-90-C-00011913.0001001 / 22 MAR 17

Applicable to: ALL

GO-AROUND

During a go-around, the PM announces:
- "BANK", if the bank angle becomes greater than 7 °
- "PITCH", if the pitch attitude becomes greater than 20 ° up or less than 10 ° up
- "SINK RATE", if there is no climb rate.

PF/PM DUTIES TRANSFER

Ident.: PRO-NOR-SOP-90-00011914.0001001 / 23 DEC 14
Applicable to: ALL

To transfer control, flight crewmembers must use the following callouts:

- To give control: The pilot calls out "YOU HAVE CONTROL". The other pilot accepts this transfer by calling out "I HAVE CONTROL", before assuming PF duties.
- To take control: The pilot calls out "I HAVE CONTROL". The other pilot accepts this transfer by calling out "YOU HAVE CONTROL", before assuming PM duties.

AIRFRAME DEICING/ANTI-ICING PROCEDURE ON GROUND

Applicable to: ALL

Ident.: PRO-NOR-SUP-ADVWXR-A-00020694.0001001 / 21 MAR 17

BEFORE FLUID SPRAYING

In all situations, it is the captain's responsibility to decide if the ground crew must deice/anti-ice the aircraft, and/or if additional deicing/anti-icing treatment are required.

CAUTION	- Make sure that the low or high-pressure ground connectors do not supply any external air to the aircraft. - If it is necessary for the ground crew to repeatedly anti-ice the aircraft, they must deice the surfaces with a hot fluid mixture before applying a new layer of anti-icing fluid.

COMMUNICATION WITH GROUND CREW.....ESTABLISH

L2 Establish communication with the crew that will apply the procedure.

L1 DEICING/ANTI-ICING FLUIDS TYPE..... CHECK APPROPRIATE

L2 Check that the ground crew uses the correct deicing/anti-icing fluids, in accordance with the applicable operator requirements and aircraft maintenance manual (AMM).

L1 DO NOT START THE ENGINES DURING FLUID SPRAYING

L2 Engines and APU can be either stopped or running during deicing/anti-icing.

L1

CAUTION	- The ground crew should take care when spraying deicing fluid, and make sure that the engines and APU do no ingest any fluid. - Do not move flaps, slats, ailerons, spoilers or elevators if they are not free of ice. - Always ensure that both left and right side of the aircraft receive the same complete and symmetrical deicing/anti-icing treatment.

L2 *Note: In case of frost formation on one or several areas of the wing, the Captain can request a local deicing application only on the affected areas. The Captain shall take care that both wings receive the same symmetrical treatment, even if frost formation does not affect both wing symmetrically. For more information, refer to AMM.*

L1 CAB PRESS MODE SEL.....CHECK AUTO
ENG 1 BLEED.....OFF
ENG 2 BLEED.....OFF
APU BLEED.....OFF

DITCHING pb..... ON

L2 *Outflow valve, pack valves, and avionic ventilation inlet and extract valves close.*
This prevents deicing/anti-icing fluid from entering the aircraft. Avionic ventilation is in a closed circuit with both fans running. In view of the low OAT, there is no time limit for this configuration.

L1 Note: *For passenger comfort reason, it is not recommended to operate on ground with both PACKS set to OFF for more than 20 min.*

Note: *If the "VENT AVNCS SYS FAULT" alert appears, reset the AEVC circuit breaker at the end of the aircraft deicing/anti-icing procedure.*
AIR COND/AVNCS VENT/CTL D06 on 49VU.
AIR COND/AVNCS/VENT/MONG Y17 on 122 VU.

THRUST LEVERS.....CHECK IDLE
"AIRCRAFT PREPARED FOR SPRAYING"..... INFORM GROUND CREW

Ident.: PRO-NOR-SUP-ADVWXR-A-00002311.0001001 / 20 SEP 16

UPON COMPLETION OF THE SPRAYING OPERATION

DITCHING pb.....OFF
OUTFLOW VALVE.....CHECK OPEN

On the ECAM PRESS page, confirm that the outflow valve indication reaches the open green position to avoid any unexpected aircraft pressurization.

ENG BLEED 1 + 2.....ON
PITOTS and STATICS (ground crew).....CHECK

CAUTION	When the OAT is low (below -5 °C) during snow/freezing rain precipitations , melted snow or raindrops may drip from the cockpit windshields and freeze on the fuselage below. This could create ice build up on the forward fuselage that could possibly disturb the airflow around the static/pitot/angle-of-attack probes, and result in unreliable air data measurements during takeoff. Therefore, during taxi out before takeoff, beware of this possible build up of ice. The area around static/pitot/angle-of-attack probes must be free of ice/snow before starting takeoff.

GROUND EQUIPMENT..... REMOVE
DEICING/ANTI-ICING REPORT.....RECEIVED

The information from ground personnel, who performed the deicing/anti-icing and post-application check, must include (ANTI-ICING CODE):

- *Type of fluid used*
- *The mix ratio of fluid to water (for example 75/25)*
- *When the holdover time began.*

- **At least 5 minutes after completion of spraying operation:**
  APU BLEED.....AS RQRD

  Note: There is a risk of de-icing fluid ingestion by the APU air intake, resulting in specific odors, or smoke warnings. Therefore:

  - *Keep the APU running with the APU BLEED OFF for 5 min after spraying completion before setting the APU BLEED to ON (if required),*
  - *Consider APU BLEED OFF for takeoff.*

NORMAL PROCEDURE..... RESUME

Apply appropriate normal procedures. Pay special attention to the flight control check. In freezing precipitation, perform the appropriate checks to evaluate aircraft icing. Base the decision on whether to takeoff, or to re-protect the aircraft, on the amount of ice that has built up on the critical surfaces since the last deicing/anti-icing, as revealed by a personal inspection from the inside and outside of the aircraft. Make this inspection before the holdover time expires, or just before takeoff.

GROUND OPERATIONS IN COLD WEATHER CONDITIONS

Ident.: PRO-NOR-SUP-ADVWXR-B-00020703.0001001 / 21 MAR 17
Applicable to: ALL

GENERAL

For ground operations on contaminated runways, *Refer to PER-TOF-CTA-10 GENERAL* and *Refer to PRO-NOR-SUP-ADVWXR General*.

The following procedures supplement the normal operating procedures.

PRELIMINARY COCKPIT PREPARATION

PRELIMINARY COCKPIT PREPARATION - SOP.....COMPLETED

L2 APU is started and the air conditioning is on.

Note: - *Ground power should be used to start the APU if the OAT is -15 °C (5 °F) or below.*
- *With cockpit temperatures below -15 °C (5 °F), the display units may not be available.*

L1 ● **If the avionics bay is cold soaked:**

L2 The aircraft was parked without electrical ground supply or without air conditioning.

L1 IRS.....INITIATE ALIGNMENT

L2 For temperatures at or below -15 °C (5 °F) in the avionics bay, the IRS alignment requires 15 min.

L1 WINDSHIELD AND UPPER COCKPIT FUSELAGE.....ICE/SNOW REMOVED

CAUTION	With ice or snow accumulated on the windshield and/or the upper cockpit fuselage, and if the PROBE/WINDOW HEAT is on, melted ice or snow running down from these areas could re-freeze on the fuselage area below, if the temperature is very low. This could create ice build-up on the forward fuselage that could possibly disturb the airflow around the static/pitot/angle-of-attack probes.

PROBE COVERS..... CHECK REMOVED

L2 Ensure that the probe covers are removed in order to prevent the covers from melting.

L1 PROBE/WINDOW HEAT.....ON

Ident.: PRO-NOR-SUP-ADVWXR-B-00020700.0001001 / 05 JUN 18
Applicable to: ALL

EXTERIOR WALKAROUND

SURFACES ..... CHECK FREE OF FROST, ICE AND SNOW

L2 Check critical surfaces: leading edges, upper wing surfaces, vertical and horizontal stabilizers, all control surfaces, slats and flaps.

Note: *Thin hoarfrost is acceptable on the upper surface of the fuselage.* *Refer to LIM-ICE_RAIN Definition of Thin Hoarfrost*

On the underside of the wing tank areas, a maximum layer of 3 mm (0.125 in) of frost is acceptable.

L1 LANDING GEAR.....CHECK FREE OF FROST, ICE AND SNOW

L2 Check gear assemblies, lever locks, tires and doors

L1 ENGINES.....CHECK FREE OF FROST, ICE AND SNOW

L2 Check inlets, inlet lips, fans, spinners, fan exhaust ducts, reversers assemblies.

L1 ENGINE FANS.....CHECK FREE ROTATION

L2 Check that engine fans are not stuck and can rotate freely.

L1 DRAINS, BLEEDS, PROBES.....CHECK FREE OF FROST, ICE AND SNOW

L2 Probes: pitot tubes, static ports, TAT sensors and AOA sensors.

L1 FUEL TANK VENTS..... CHECK FREE OF FROST, ICE AND SNOW
RADOME..... CHECK FREE OF FROST, ICE AND SNOW
Lower part of the NOSE FUSELAGE..... CHECK FREE OF FROST, ICE AND SNOW
WATER SUPPLIES..... CHECK NOT FROZEN AND REFILLED

L2 Commercial water supplies should have been previously emptied prior to aircraft cold soak.

Ident.: PRO-NOR-SUP-ADVWXR-B-00020701.0001001 / 21 MAR 17
Applicable to: ALL

AFTER START

- **After first engine start:**
  PROBE/WINDOW HEAT.....AUTO

L2 Heating will continue to operate automatically.

L1 NORMAL PROCEDURE.....RESUME

Ident.: PRO-NOR-SUP-ADVWXR-B-00021770.0001001 / 13 JUN 17
1 **Applicable to: MSN 06720-09063**

TAKEOFF

- **If OAT below -40 °C (-40 °F), perform the following action before takeoff:**
  THRUST REVERSERS..... PERFORM 5 CYCLES

L2 To perform 1 cycle, put the thrust levers to REV IDLE and maintain until the REV indication on the Engine/Warning display becomes green. Then put the thrust levers back to IDLE and wait for the REV indication to disappear before the next cycle.

Note: *1. Takeoff has to be initiated within one minute after the last thrust reversers cycle.*
2. If the takeoff is not performed within one minute after the last thrust reversers cycle, repeat each time the 5 thrust reversers cycles.

Ident.: PRO-NOR-SUP-ADVWXR-B-00021770.0002001 / 23 FEB 18
2 **Applicable to: MSN 01957-02359, 02405-02482, 02609-02670, 02737-03071, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-06336**

TAKEOFF

- **If OAT below -40 °C (-40 °F), perform the following action before takeoff:**
  THRUST REVERSERS..... PERFORM 6 CYCLES

L2 To perform 1 cycle, put the thrust levers to REV IDLE and maintain until the REV indication on the Engine/Warning display becomes green. Then put the thrust levers back to IDLE and wait for the REV indication to disappear before the next cycle.

Note: 1. Takeoff has to be initiated within one minute after the last thrust reversers cycle.
2. If the takeoff is not performed within one minute after the last thrust reversers cycle, repeat each time the 6 thrust reversers cycles.

GROUND OPERATIONS IN HEAVY RAIN

Ident.: PRO-NOR-SUP-ADVWXR-00020720.0001001 / 21 MAR 17
Applicable to: ALL

On ground (Aircraft taxiing or parked) in case of heavy rain, water may enter the avionics ventilation system via the skin air inlet valve.

- **When on ground:**
  EXTRACT.....OVRD

L2 This closes the skin air inlets, preventing rainwater from entering the avionics bay.

L1 PACK 1 ON..... CHECK
PACK 2 ON..... CHECK

L2 Air conditioning compensates the avionics cooling reduction when the skin air inlet is closed.

L1 - **If air conditioning not available:**

L2 When the aircraft avionics are powered, closing the skin air inlet valve reduces avionics cooling capability. With air conditioning not available, the reduced cooling is efficient for a limited period of time, depending on the outside temperature.

L1 Aircraft should not remain powered more than:
- OAT ≤ 39 °C (102 °F): no limit
- 39 °C (102 °F) < OAT ≤ 45 °C (113 °F): 3 h
- 45 °C (113 °F) < OAT: 30 min

- **After takeoff:**
  EXTRACT..... AUTO

MINIMUM SPEED WITH ICE ACCRETION

Ident.: PRO-NOR-SUP-ADVWXR-00020722.0002001 / 21 MAR 17
Applicable to: ALL

Evidence of ice accretion can be ice on the visual indicator (between the two cockpit windshields) or on the windshield wipers.

CAUTION	Extended flight in icing conditions with the slats extended should be avoided.

- **If wing anti ice is operative:**
  - **In CONF clean, 1, 2 or 3:**
    MIN SPEED: VLS + 10 kt
  - **In CONF FULL:**
    MIN SPEED: VLS + 5 kt

  The minimum speed takes into account ice accretion on non-heated structure.

- **If wing anti ice is not operative:**
  MIN SPEED: VLS + 10 kt/GREEN DOT

  The minimum speed takes into account ice accretion on the entire airframe when anti-ice is inoperative.

OPERATIONS ON CONTAMINATED AIRPORTS

Applicable to: ALL

Ident.: PRO-NOR-SUP-ADVWXR-C-00020729.0001001 / 21 MAR 17

GENERAL

If the ground surfaces are not contaminated but the weather corresponds to icing conditions with falling rain, slush or snow, anticipate a probable resulting runway/surfaces contamination.
There is a low probability of fluid ingestion by the engines which should anyway not degrade the safety. The risk of ingestion is independent of the depth of the contaminant.

Ident.: PRO-NOR-SUP-ADVWXR-C-00020726.0002001 / 21 MAR 17

SPURIOUS ALERTS

The radio altimeter indication may fluctuate on contaminated surfaces and trigger auto callouts or GPWS warnings. These alerts can be disregarded.

Note: Spurious GPWS warnings may trigger at the apron, during taxi, takeoff and landing runs.

The radio altimeter may also not compute valid data:
- On surfaces covered with snow, ice or deicing fluid, and/or
- Due to deicing fluid on the antenna.

Note: As a result, the "NAV RA 1(2)(1+2) FAULT" ECAM alert may be triggered. This alert may disappear when the radio altimeter provides valid data again, when:

- The aircraft is on a non-contaminated surface, or
- The antenna is cleaned, or
- A period of time elapses after deicing, allowing the fluid covering the antenna to dry. The taxi time between deicing spot and holding point may be sufficient.

In case of invalid LGCIU information, disregard the following alerts if triggered:
- ENG DUAL FAILURE
- ANTI-ICE CAPT(F/O) TAT FAULT
- L/G SHOCK ABSORBER FAULT

Ident.: PRO-NOR-SUP-ADVWXR-C-00020725.0001001 / 21 MAR 17

PARKING

● **After engine shutdown and before shutting down electrical supply:**
FLAPS/SLATS..... CONFIRM FREE OF CONTAMINATION

L2 Perform a visual inspection to determine if the flaps/slats mechanism is free of contamination. If necessary, perform decontamination.

L1 YELLOW ELEC PUMP pb..... ON
BLUE ELEC PUMP pb..... AUTO
BLUE PUMP OVRD pb..... ON
SLATS/FLAPS..... RETRACT

L2 *Monitor slats/flaps retraction on ECAM upper display.*

L1 ● **When slats and flaps are retracted:**
YELLOW ELEC PUMP pb..... OFF
BLUE PUMP OVRD pb..... OFF
NORMAL PROCEDURE..... RESUME

OPERATIONS WITH VOLCANIC ASH, SAND OR DUST

Ident.: PRO-NOR-SUP-ADVWXR-G-00020733.0001001 / 21 MAR 17
Applicable to: ALL

PRELIMINARY COCKPIT PREPARATION

APU..... AVOID USE

L2 *Request ground power for air conditioning and electricity. If ground power is not available, the APU should be used only to start the engines.*

L1 WINDSHIELD WIPERS..... DO NOT USE

L2 *Do not use the windshield wipers to remove ash, sand or dust.*

L1 ● **For takeoff performance:**

BRAKING PERFORMANCE MAY BE DEGRADED

L2 A layer of volcanic ash, sand or dust on the runway may degrade the braking efficiency.

Ident.: PRO-NOR-SUP-ADVWXR-G-00020734.0001001 / 21 MAR 17
Applicable to: ALL

EXTERIOR WALKAROUND

SURFACES AND EQUIPMENT.....CHECK FREE OF DEPOSITS

L2 *Ground maintenance should remove ash, sand or dust that has settled on exposed lubricated surfaces and could penetrate seals or enter the engine gas path, air conditioning system, air data probes, access doors and panels and other orifices on the aircraft.*

L1 ENGINE/APU INLETS..... CHECK FREE OF DEPOSITS

L2 Inspect the inlets and order them cleaned of deposit. Have the area within 8 m (25 ft) of the engine inlet cleaned of volcanic ash, as much as practical.

Ident.: PRO-NOR-SUP-ADVWXR-G-00020735.0001001 / 27 FEB 18
Applicable to: ALL

ENGINE START

Use external pneumatic supply, if available, to start the engines. *Refer to PRO-NOR-SUP-ENG Engine Start with External Pneumatic Power.*

ENGINE..... CRANK

L2 *Before starting the engines, ventilate them by dry cranking at maximum motoring speed for two minutes. This will blow away any contaminant ash that may have entered the booster area. Refer to PRO-NOR-SUP-ENG Engine Ventilation (Dry Cranking)*

Ident.: PRO-NOR-SUP-ADVWXR-G-00022532.0002001 / 16 OCT 18
3 **Applicable to: MSN 01767-06336**

AFTER START

ENG ANTI-ICE pb-sw.....ON for 10 s

L2 *Engine anti-ice should be operated on both engines for about 10 s after the first engine start of the day in order to flush any sand and/or dust which could affect later operation of Engine Anti-Ice system.*

Ident.: PRO-NOR-SUP-ADVWXR-G-00020736.0001001 / 21 MAR 17
Applicable to: ALL

TAXI

ONE ENGINE TAXI.....DO NOT PERFORM

L2 *Minimize the thrust during taxi.*

L1 ENG 1 BLEED.....OFF
ENG 2 BLEED.....OFF

L2 Keep engine bleed valves closed for taxiing, especially in volcanic ash.

L1 FOR 180 ° TURN ON RUNWAY: INITIATE THE TURN DOWNWIND

L2 In order to prevent ash, sand or dust ingestion.

Ident.: PRO-NOR-SUP-ADVWXR-G-00020737.0001001 / 21 MAR 17
Applicable to: ALL

TAKEOFF

ASH, SAND OR DUST..... ALLOW TO SETTLE

L2 *Allow ash, sand or dust to settle on runway before starting the takeoff roll.*

L1 PACK OFF TAKEOFF..... CONSIDER

L2 *This will prevent air conditioning system contamination.*

L1 ROLLING TAKEOFF.....CONSIDER

Ident.: PRO-NOR-SUP-ADVWXR-G-00020738.0001001 / 21 MAR 17
Applicable to: ALL

AFTER TAKEOFF

MINIMIZE TIME IN SAND OR DUST CLOUD

L2 *Climb to quickly exit the sand/dust cloud. If possible, altitude constraints may be disregarded in coordination with ATC.*

L1 ENG 1 BLEED.....ON
ENG 2 BLEED.....ON

Ident.: PRO-NOR-SUP-ADVWXR-G-00020739.0001001 / 21 MAR 17
Applicable to: ALL

IN FLIGHT

AVOID ASH, SAND OR DUST CLOUD

- **If sand or dust cloud encounter:**

MINIMIZE TIME IN SAND OR DUST CLOUD

L2 *If possible and in coordination with ATC, adapt flight path (route and altitude) to exit the cloud.*

L1 ● **If ash cloud encounter:**
VOLCANIC ASH ENCOUNTER PROCEDURE..... APPLY

Refer to PRO-ABN-MISC [QRH] VOLCANIC ASH ENCOUNTER .

Ident.: PRO-NOR-SUP-ADVWXR-G-00020740.0001001 / 21 MAR 17
Applicable to: ALL

DESCENT PREPARATION

AUTOLAND RECOMMENDED

L2 *Deposits on the windshield and landing lights may significantly reduce visibility during approach and landing. Consider a diversion to an airport where autoland is possible.*

L1 ● **For landing performance:**
CONSIDER IDLE REVERSE
BRAKING PERFORMANCE MAY BE DEGRADED

L2 *A layer of volcanic ash, sand or dust on the runway may degrade the braking efficiency.*

Ident.: PRO-NOR-SUP-ADVWXR-G-00020741.0001001 / 21 MAR 17
Applicable to: ALL

DESCENT

AVOID LEVEL FLIGHT IN ASH, SAND OR DUST CLOUD

If possible and in coordination with ATC, perform holding patterns and last level off before final descent outside of the cloud.

Ident.: PRO-NOR-SUP-ADVWXR-G-00020742.0001001 / 21 MAR 17
Applicable to: ALL

LANDING

● **Before Landing:**
ENG 1 BLEED..... OFF
ENG 2 BLEED..... OFF
PACK 1 and 2..... AS REQUIRED

L2 *Consider to set the packs OFF in order to avoid contamination of the air conditioning system.*

L1 ● **During Landing:**
REVERSERS.....AS REQUIRED

L2 *If it appears that maximum reverse thrust is needed, apply reverse thrust when the main landing gear touches down. Limit the use of reverse thrust as much as possible, because reverse flow may throw up ash, sand or dust and impair visibility.*

Ident.: PRO-NOR-SUP-ADVWXR-G-00020744.0001001 / 21 MAR 17
Applicable to: ALL

AFTER LANDING

ONE ENGINE TAXI.....DO NOT PERFORM

L2 *Minimize thrust during taxi.*

L1 APU.....AVOID USE

FOR 180 ° TURN ON RUNWAY: INITIATE THE TURN DOWNWIND

Ident.: PRO-NOR-SUP-ADVWXR-G-00020745.0001001 / 21 MAR 17
Applicable to: ALL

SECURING THE AIRCRAFT

If the aircraft is parked at an airport covered with volcanic ash, sand or dust, install engine inlet covers and other protective covers and plugs.
In addition:

- **After switching off all bleeds and before switching off the electrical AC power:**
  DITCHING pb.....ON

L2 *This closes the outflow valve, pack valves and avionics ventilation inlet and extract valves.*

L1
- **After switching off the electrical AC power and the batteries:**
  DITCHING pb.....OFF

L2 *All the applicable valves will open at the next power-up.*

L1 PROTECTIVE COVERS.....INSTALL

L2 Request ground crew to install protective covers and plugs, in order to protect the aircraft and engines from volcanic ash, sand or dust.

L1 LOGBOOK..... REPORT ASH, SAND OR DUST CLOUD ENCOUNTER

SECURING THE AIRCRAFT FOR COLD SOAK

Ident.: PRO-NOR-SUP-ADVWXR-00020772.0001001 / 21 MAR 17
Applicable to: ALL

WHEN SECURING THE AIRCRAFT

- **After switching off all bleeds and before switching off the electrical AC power:**
  DITCHING pb.....ON

L2 *This closes the outflow valve, pack valves and avionics ventilation inlet and extract valves.*

L1 ● **When the chocks are in place:**
PARKING BRAKE pb.....OFF

L2 *Releasing the parking brake prevents the brakes from freezing.*

L1 ● **After switching off the electrical AC power and the batteries:**
DITCHING pb.....OFF

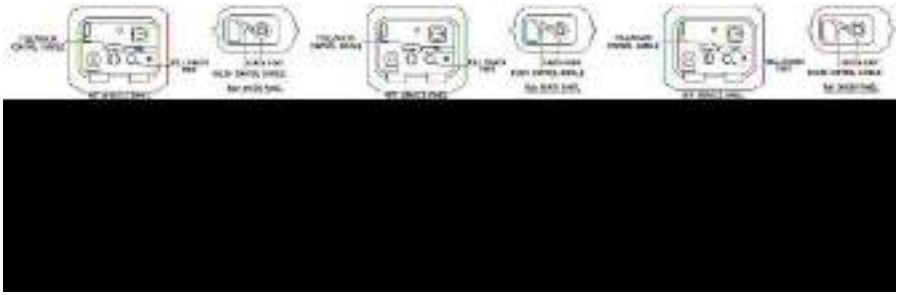
L2 *All the applicable valves will open at the next power-up.*

L1 PROTECTIVE COVERS.....INSTALL

L2 *Request ground crew to install protective covers and plugs, in order to protect the wheels, the engines and the probes from snow and ice.*

L1 WATER SYSTEM DRAINING.....REQUEST

L2 *Request maintenance actions to drain the water system for cold soak prevention purposes.*
Refer to PRO-NOR-SUP-ADVWXR Water System Draining.



FOR DRAINING WATER PROCEDURE

Applicable to: ALL

Ident.: PRO-NOR-SUP-ADVWXR-D-00002313.0001001 / 21 MAR 17

INTRODUCTION

This procedure uses electrical power.

ACCESS PLATFORM(S).....PUT IN POSITION
SHUTOFF VALVE IN GALLEYS/TOILETS..... CHECK OPEN
FWD/AFT ACCESS PANEL DOORS.....OPEN
DRAIN PORT CAPS..... REMOVE

Remove drain port caps on forward drain and aft service panels.

DRAIN HOSES.....CONNECT

Connect drain hoses to :
- *the drain port on the forward drain panel.*
- *the full/drain port on the aft service panel.*

Ident.: PRO-NOR-SUP-ADVWXR-D-00002314.0001001 / 21 MAR 17

ON THE FORWARD DRAIN PANEL

DRAIN CONTROL HANDLE.....TURN LEFT

Turn the control handle to drain.

Ident.: PRO-NOR-SUP-ADVWXR-D-00002315.0001001 / 21 MAR 17

ON THE AFT SERVICE PANEL

FILL/DRAIN CONTROL HANDLE.....TURN TO “DRAIN” AND PULL

Turn the handle to the “DRAIN” position and pull it out to its mechanical stop to drain.
The indicator light comes on.

Ident.: PRO-NOR-SUP-ADVWXR-D-00002316.0001001 / 21 MAR 17

WHEN THE WATER SYSTEM IS DRAINED

In freezing conditions, the drain valves must stay open to prevent damage to the system. Do not put on the caps and leave the access door open.

DRAIN HOSES.....DISCONNECT
PANELS..... CLEAN AND DRY
ACCESS PLATFORM(S)..... REMOVE

WATER SYSTEM DRAINING

Ident.: PRO-NOR-SUP-ADVWXR-00002205.0001001 / 21 MAR 17
Applicable to: ALL

Drain the water system, if the OAT requires it, as shown below :

Configuration			Exposure time	Water tank drain
Air Conditioning	**Cabin temperature**	**Outside Air Temperature**		
ON	Above 10 °C (50 °F)	Between 0 °C and -15 °C (32 °F and 5 °F)	None	Not required
		Below -15 °C (5 °F)	1 h 15 min	Required
OFF		Between 0 °C and -7 °C (32 °F and 19.4 °F)	1 h 30 min	
		Between -7 °C and -15 °C (19.4 °F and 5 °F)	0 h 30 min	
		Below -15 °C (5 °F)	Any

MANUAL ENGINE START

Ident.: PRO-NOR-SUP-ENG-A-00009443.0004001 / 25 FEB 14
Applicable to: MSN 01767-01920, 02388, 02584, 02712, 03138, 03750, 04314, 04393-04438, 04510

Pilots normally use automatic starting to start an engine.

However, manual starting is recommended in the following cases:

- **After aborting a start, because of:**
  - Engine stall
  - Engine EGT overlimit
  - Low start air pressure
- **When expecting a start abort, because of:**
  - Degraded bleed performance, due to hot conditions, or at a high-altitude airfields.
  - An engine with a reduced EGT margin, in hot conditions, or at a high-altitude airfields.
  - Marginal performance of the external pneumatic power group.
  - Intermittent ECAM ENG 1(2) IGN A(B) FAULT alert, during the first start of the day.

Ident.: PRO-NOR-SUP-ENG-A-00009443.0002001 / 21 MAR 17
1 **Applicable to: MSN 01957-02359, 02405-02482, 02609-02670, 02737-03071, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-06336**

Pilots normally use automatic starting to start an engine.

However, manual starting is recommended in the following cases :

- **After aborting a start, because of :**
  - Engine stall, or Engine EGT overlimit, or LO START AIR PRESS, or No N1 rotation, or Hung start.
- **When expecting a start abort, because of :**
  - Degraded bleed performance, due to hot conditions, or at a high-altitude airfields.
  - An engine with a reduced EGT margin, in hot conditions, or at a high-altitude airfields.
  - Marginal performance of the external pneumatic power group.
  - Tailwind greater than 10 kt
    Starting in tailwind may fail due to N1 counterrotation, hot gas black flow. Fuel should be set to ON at N2 max motoring speed, provided N1 has stopped, and turn clockwise. (confirmation by the ground crew).

Ident.: PRO-NOR-SUP-ENG-A-00009443.0001001 / 21 MAR 17
Applicable to: MSN 04294

Pilots normally use automatic starting to start an engine.

However, manual starting is recommended in the following cases:

- **After aborting a start, because of:**
  - Engine stall
  - Engine EGT overlimit
  - Low start air pressure
- **When expecting a start abort, because of:**
  - Degraded bleed performance, due to hot conditions, or at a high-altitude airfields.
  - An engine with a reduced EGT margin, in hot conditions, or at a high-altitude airfields.
  - Marginal performance of the external pneumatic power group.

Ident.: PRO-NOR-SUP-ENG-A-00009443.0005001 / 12 SEP 17

2 **Applicable to: MSN 06720-09063**

Pilots normally use automatic starting to start an engine.

However, manual starting is recommended in the following cases:

- **After aborting a start, because of:**
  - Engine stall
  - Engine EGT overlimit
  - Low start air pressure
  - Hung start
- **When expecting a start abort, because of:**

3 **Applicable to: MSN 01957-02359, 02405-02482, 02609-02670, 02737-03071, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-06336**

MANUAL ENGINE START PROCEDURE

Note: During a manual engine start, if the flight crew suspects an engine start malfunction, or if an engine-related ECAM alert is triggered, the PF must abort the start sequence as follows:

- *Before the ENG MASTER lever is set to ON, the PF must set the ENG MAN START pb-sw to OFF*
- *After the ENG MASTER lever is set to ON, the PF must set the ENG MASTER lever to OFF, and then the ENG MAN START pb-sw to OFF.*
  In that case, the flight crew should consider a dry crank cycle of the affected engine before they perform another start attempt (Refer to PRO-NOR-SUP-ENG Engine Ventilation (Dry Cranking)).

Then, in the case of an ECAM alert, the PF must announce "ECAM actions", in accordance with the ECAM management philosophy.

THR LEVERS.....IDLE

CAUTION	The engines start regardless of the thrust lever position. If the thrust levers are not set to IDLE, the thrust rapidly increases to the corresponding thrust lever position, causing a hazardous situation.

ENG MODE sel..... NORM THEN IGN/START

L2 *The lower ECAM displays the engine page.*

L1 *Note: If both engines are started manually, the following procedure applies one engine at a time.*

- **When all engines parameters (except N1 and N2) are available on the upper ECAM display (no amber crosses displayed):**
  ENG MAN START pb-sw..... ON
  START VALVE.....CHECK IN-LINE
  N2 INCREASE..... CHECK
  OIL PRESS INCREASE..... CHECK
  - **If the N2 does not reach 16 %:**
    PACK VALVES.....CHECK CLOSED
    - **If the APU bleed is used for engine start and the pack valves are closed, shed the APU electrical loads as follows:**

L2 Shedding APU electrical loads enables to increase bleed air pressure.

L1 GALY & CAB.....OFF

- **If needed, shed also:**

  BLUE ELEC PUMP (on ground only).....OFF
  FUEL X FEED.....ON
  FUEL PUMPS (except R TK PUMP 2).....OFF
  BLOWER.....OVRD
  CAB FANS.....OFF

  - **If additional shedding is required:**

    HYD ENG PUMP.....OFF

    Return the hydraulic engine pump to ON for second engine start, to permit PTU auto test.

- **When N2 reaches the maximum motoring speed (16 % minimum) and 30 s after selection of the ENG MAN START pb-sw:**

  Note: *The maximum motoring speed is reached when a significant decrease in N2 acceleration is observed.*
  Do not attempt to start unless N2 is at least 16 %.

  In hot weather conditions (OAT at or above 40 °C / 104 °F):
  - If the residual EGT is above 100 °C, perform a 2 min dry crank in order to reduce the residual EGT to the minimum achievable. *Refer to PRO-NOR-SUP-ENG Engine Ventilation (Dry Cranking)*. Following the dry crank if the residual EGT is below 250 °C, the manual start can be attempted after a 15 s wait time for starter lubrication.
  - Starting with a residual EGT above 250 °C is not recommended.

  ENG MASTER.....ON
  CHRONO.....START

L2 *The PM starts the timing in order to monitor the light-up duration.*

L1 IGNITERS A AND B.....CHECK ON
FUEL FLOW INCREASE.....CHECK

L2 *With current EEC standard, fuel flow indication spiking occurs at fuel on.*

L1 - **20 s maximum after fuel flow increase:**

  EGT INCREASE.....CHECK
  N1 INCREASE (before 34 % N2).....CHECK

  If the electrical power supply is interrupted during the start sequence (indicated by the loss of ECAM displays), abort the start by setting the ENG MASTER lever to OFF. Then perform a 30 s dry crank *Refer to PRO-NOR-SUP-ENG Engine Ventilation (Dry Cranking)*.

- **When N2 reaches 43 %:**

  IGNITERS A AND B (at 43 % N2).....CHECK OFF
  START VALVE (slightly above 43 % N2).....CHECK CROSS LINE

MAIN ENG PARAMETERS.....CHECK NORMAL
SECONDARY ENG PARAMETERS.....CHECK NORMAL

L2 *The gray background on the N2 indication disappears.*

L1 ENG MAN START pb-sw.....OFF
ENG MODE sel.....NORM

- **When no other engine requires to be started manually:**
  SHEDDED SYSTEMS.....RESTORE
  SOP - ENGINE START.....RESUME

AIR CONDITIONING DURING AUTOMATIC ENGINE START

Ident.: PRO-NOR-SUP-ENG-00021159.0002001 / 04 MAY 18

9 **Applicable to: MSN 06720-09063**

During automatic engine start, the FADEC commands a dry crank that may significantly extend the engine start duration. This procedure enables to use the air conditioning during the start sequence of the engine 1 in order to enhance passenger's comfort.
This procedure can only be used if engine 2 is started before engine 1, as per Standard Operating Procedures, with APU bleed or external pneumatic power.

ENG 2..... START

- **When idle is reached (AVAIL indication is displayed):**
  XBLEED.....SHUT

L2 *The PACK 2 Flow Control Valve will automatically open.*

NORMAL PROCEDURE..... RESUME

ENGINE START VALVE MANUAL OPERATION

Ident.: PRO-NOR-SUP-ENG-00020861.0010001 / 17 MAR 17

10 **Applicable to: MSN 06720, 06772, 06829, 06904-09063**

BEFORE ENGINE START

Before the manual override of the start valve, respect the below minimum time after the last engine shutdown:

Airport Elevation (ft above Sea Level)	Minimum Engine Shutdown Time (h) (1)
4 000 and below	9
4 001 to 5 000	9.5

Continued on the following page

Continued from the previous page

Airport Elevation (ft above Sea Level)	Minimum Engine Shutdown Time (h) (1)
5 001 to 10 000	10
Above 10 000	10.5

(1) *These times apply only for engines that have performed normal flight operations and have followed the recommended 3 min idle cool down prior to shutdown. If not operated in this manner, 12 h must be observed.*

Advise ground crew to prepare for manual engine start valve operation.

WARNING	To ensure safety of the ground crew when starting an engine with manual operation of the start valve, the flight crew should start the affected engine first.

ENGINE VENTILATION (DRY CRANKING)

Ident.: PRO-NOR-SUP-ENG-00020943.0003001 / 17 MAR 17

12 **Applicable to: MSN 06720-09063**

On ground, after:
- An unsuccessful manual engine start, or
- An unsuccessful automatic start not followed by an automatic dry crank,

the flight crew can perform a dry crank cycle on the affected engine to remove the fuel vapors.

- **Before dry crank:**
  ENG MASTER (affected engine)..... CHECK OFF
  ENG MODE sel..... CHECK NORM
  ENG MAN START pb-sw (affected engine).....CHECK OFF

- **Dry crank:**
  ENG MODE sel..... CRANK
  ENG MAN START pb-sw (affected engine).....ON

Note: To clear fuel vapors, a 30 seconds dry crank cycle is the minimum required.

L2 *Note: A manual start sequence can be initiated following a dry crank cycle (Refer to PRO-NOR-SUP-ENG Manual Engine Start - Procedure). The flight crew should consider the starter limitations (Refer to LIM-ENG Starter).*

Note: Depending on the engine thermal state, the FADEC can command an automatic dry cranking (or engine cooling) with the associated COOLING indication displayed on the E/WD. Refer to DSC-70-80-40 Engine CoolingAfter approximately 2 min, the automatic bowed rotor protection cranking stops, the N2 value is no longer limited at around 10% and increases up to the maximum motoring speed. At the same time, the COOLING indication disappears from the E/WD.

L1 ● **When the dry crank is completed:**
ENG MAN START pb-sw (affected engine)..... OFF
ENG MODE sel..... NORM

ENGINE VENTILATION (DRY CRANKING)

Ident.: PRO-NOR-SUP-ENG-00020943.0001001 / 17 MAR 17
13 **Applicable to: MSN 01767-06336**

On ground, after:
- An unsuccessful manual engine start, or

ENG MAN START pb-sw (affected engine)..... OFF

ENG MODE sel.....NORM

ONE ENGINE TAXI - GENERAL

Applicable to: ALL

Ident.: PRO-NOR-SUP-ENG-CA-00021004.0001001 / 17 MAR 17

Except in some operational conditions (e.g. uphill slopes, slippery taxiways or high gross weights), brake life and fuel savings may govern company policy on permitting aircraft to taxi with one engine shut down.

Before applying this procedure, the flight crew should be aware of the following:

- Taxi with one engine shut down may require higher thrust than usual. Caution must therefore be exercised to avoid excessive jet-blast and the risk of Foreign Object Damage (FOD)
- Slow or tight turns in the direction of the operating engine may not be possible at high gross weights
- When one engine taxi is planned, pay particular attention to the fuel imbalance limitation for the next take-off.

ONE ENGINE TAXI - AT DEPARTURE

Ident.: PRO-NOR-SUP-ENG-CB-00021005.0003001 / 17 MAR 17

14 **Applicable to: MSN 06720-09063**

BRAKE ACCU PRESS.....CHECK

L2 *If necessary, use the Y ELEC PUMP to pressurize the brake accumulator.*

L1 ENG 1..... START

L2 *Engine 1 pressurizes the green hydraulic system, providing normal braking.*

L1 APPLY THE “AFTER START” NORMAL PROCEDURE, BUT:

- The APU can be kept running. In that case, switch the APU BLEED to OFF.

L2 The APU generator provides power to prevent electrical transients and enable galley and IFE operation. Closing the APU BLEED prevents engine exhaust gases ingestion in the air conditioning system.

L1 - If the APU is shut down, the remaining engine should be started using the Crossbleed Engine Start procedure (*Refer to PRO-NOR-SUP-ENG Crossbleed Engine Start*).

- Delay the ECAM STATUS check and the wing anti-ice setting until all engines are started.

REFUELING

Ident.: PRO-NOR-SUP-FUEL-A-00021256.0002001 / 25 JUL 17
Applicable to: ALL

WARNING	1. Prior initiation of any ground fuel operations, obey the below fuel safety precautions. This will prevent injury to people and/or damage to the aircraft. 2. Do not request or perform any ground fuel operations if a fire or engine overheat warning is displayed. 3. f the APU fails during any ground fuel operations, do not restart the APU. For APU use during refueling/defueling *Refer to LIM-APU APU Start/Shutdown during Refueling/Defueling*. 4. Do not refuel in bad weather conditions and electrical storms.

PREPARATION

SAFETY PRECAUTIONS.....APPLY

During refueling operations, ensure that:
- *HF transmission (including HF transmission via the HF DATA LINK ◁ pb) is not performed*
- *The aircraft is properly bonded to the tanker*
- *The tanker and the aircraft grounding requirement is based on local regulations. Always connect the ground cable to the parking ground point (or to the tanker) before connecting it to the aircraft.*
- *The external lighting is not operated (except for NAV & LOGO).*

In the cockpit, check that the PARK BRK is ON and that the ACCU PRESS has sufficient pressure. If the PARK BRK cannot be set to ON, check that the chocks are in place.

ACCESS PLATFORM.....IN POSITION
MAX REFUELING PRESSURE: 50 PSI (3.5 bar)

- **On refueling control panel:**

  TEST sw..... LTS

  Lights on the panel come on. FUEL QTY and the PRESELECTED and ACTUAL displays show 8's.

  TEST sw.....HI.LVL

  HI LVL lights change state if the high level sensors and their circuits are serviceable.

REFUELING WITH ONE ENGINE RUNNING

Ident.: PRO-NOR-SUP-FUEL-00001677.0003001 / 21 MAR 17
2 **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

- Refuel with one engine running only at airports where no external ground pneumatic power is available and only when APU is unserviceable.
- Only the RH fuel couplings can be used.
- Overwing gravity filling is not permitted.
- Disembark all passengers.
- Obtain airport authorization.
  The Airport Fire Department should standby at the aircraft during the entire refueling procedure.
- Point the aircraft into the wind at a location where the slope is negligible.
  Set the parking brake and check its pressure.
  Run engine n° 1 at ground idle with its generator connected.
- Do not start engine n° 2, do not shut down engine n° 1 or do not attempt to start the APU before all fueling operations have been completed.
- Position the fuel truck under the extremity of the right wing. Its pressure should not exceed 30 PSI.
- Follow manual refueling procedure.

OPERATION MONITORING

DURING THE ENTIRE REFUELING PROCEDURE :

- Monitor the fuel truck shut off valve.
- Be sure that the fueling company is keeping permanent control of the emergency fuel shut off device.
- Have a flight crew member in the cockpit monitoring all systems and the running engine.

- Have a qualified ground crew member at the fueling station to operate the refuel valve switches.
- Monitor the refueling closely and be prepared to close the refuel valves in order not to exceed the following fuel quantities :

DENSITY (kg/l)	0.77	0.78	0.79	0.8	0.81	0.82	0.83
L(R) WING (kg)	5 710	5 780	5 860	5 930	6 005	6 080	6 160
CENTER (kg)	6 030	6 110	6 190	6 270	6 350	6 430	6 500

AFTER SECOND ENGINE START :

- **Reset the 3DMCs in order to reinitialize the fuel used values :**
  DMC 1 SPLY C/B (E11 on 49VU)..... PULL
  DMC 2 SPLY C/B (Q8 on 121 VU).....PULL
  DMC 3 SPLY C/B (Q9 on 121 VU).....PULL
  DMC 3 SPLY STBY (E10 on 49 VU).....PULL
  - **After 5 s :**
    All C/B's.....PUSH

    Note: *The T.O MEMO does not appear automatically since one engine is kept running.*

Flight with Landing Gear Down

GENERAL

Ident.: PRO-NOR-SUP-LG-LG_DN-00001997.0001001 / 04 SEP 17
Applicable to: ALL

It is possible to perform a flight with the landing gear locked down and the doors closed.

This chapter applies to either of the following two situations:
- The dispatch of an aircraft with the landing gear down, or
- The continuation of the flight when a landing gear retraction failure happens after takeoff.

The limitations, procedures and performance associated to a flight with the landing gear down are described below.

LIMITATIONS

Ident.: PRO-NOR-SUP-LG-LG_DN-00001999.0003001 / 04 DEC 17
1 **Applicable to: MSN 06720-09063**

For a flight with the landing gear down, all of the following supplementary limitations apply:
- Consider a VMO/MMO of 235 kt/M 0.60
- Landing gear doors must be closed
- Avoid icing conditions
- Do not use managed speeds, except during the approach
- Do not use CLB and DES autopilot modes
- Disregard FMS fuel, altitude, speed, and time prediction. Time prediction is valid on waypoints in cruise only
- Use the TCAS in TA ONLY mode
- The ALTITUDE ALERT feature is not available
- Do not perform ETOPS flight.
- Apply only TOGA thrust for go-around (soft go-around function is not designed to be used with the L/G in the extended position, the flight crew must select TOGA thrust for go-around).

Note: *Ditching with the landing gear down is not assessed.*

LIMITATIONS

Ident.: PRO-NOR-SUP-LG-LG_DN-00001999.0002001 / 04 SEP 17
2 **Applicable to: MSN 01767-06336**

For a flight with the landing gear down, all of the following supplementary limitations apply:
- Consider a VMO/MMO of 235 kt/M 0.60
- Landing gear doors must be closed

- Avoid icing conditions
- Do not use managed speeds, except during the approach
- Do not use CLB and DES autopilot modes
- Disregard FMS fuel, altitude, speed, and time prediction. Time prediction is valid on waypoints in cruise only
- Use the TCAS in TA ONLY mode
- The ALTITUDE ALERT feature is not available
- Do not perform ETOPS flight.

Note: Ditching with the landing gear down is not assessed.

PROCEDURES

Ident.: PRO-NOR-SUP-LG-LG_DN-B-00002000.0002001 / 04 SEP 17
Applicable to: ALL

PREFLIGHT

In addition to the SOPs apply the following:

- **VMO/MMO setting:**
  VMO-MMO sw.....L/G DOWN

L2 *The switch is located in the avionics compartment (on the 188VU panel). This switch changes the VMO/MMO to 235 kt/M 0.60. As a result, an alert is triggered if the speed exceeds the flight with gear down speed limitation.*

L1

CAUTION	*In the case of continuation of the flight after a gear retraction failure, the flight crew can not access the VMO/MMO switch. Therefore, the airspeed/Mach number must be carefully monitored in order not to exceed 235 kt/M 0.60 as there is no alert if the aircraft exceeds this limitation.*

Ident.: PRO-NOR-SUP-LG-LG_DN-B-00002003.0051001 / 04 SEP 17
3 **Applicable to: MSN 06720-09063**

FLIGHT CONTROLS

Failure cases, which would normally lead to ALTN law, will degrade F/CTL laws down to DIRECT law, if the landing gear is extended (except for the Yaw Damper loss where the controls remain in alternate law).

FAILURE OF BOTH ENGINES

When both engines are failed, to ease the management of all the different ECAM procedures that result from this all engine flame out situation, it is recommended to use the ALL ENGINES FAILURE QRH procedure, and if time permits, to clear the ECAM.

Follow all the steps of the QRH procedure, except those that are modified by the procedure below :

■ **If the APU is not available**

- Attempt an APU start
- If the APU start is unsuccessful, a windmill relight can be performed, as long as the speed is above 260 kt. In this case, increase the aircraft speed and disregard the VMO warning.

■ **If APU is available :**

- Perform an assisted relight, when below FL 200.

Flight controls are in direct laws. Use manual pitch trim as necessary (not indicated on PFD if APU GEN is not available).

Ident.: PRO-NOR-SUP-LG-LG_DN-B-00002003.0048001 / 04 SEP 17
Applicable to: MSN 05437-06336

FLIGHT CONTROLS

Failure cases, which would normally lead to ALTN law, will degrade F/CTL laws down to DIRECT law, if the landing gear is extended (except for the Yaw Damper loss where the controls remain in alternate law).

FAILURE OF BOTH ENGINES

When both engines are failed, to ease the handling of all the different ECAM procedures resulting from this all engine flame out situation, it is recommended to use the ENG DUAL FAILURE QRH procedure, and if time permits, to clear the ECAM.
Follow all the steps of the QRH procedure, except those that are modified by the procedure below :

■ **If APU is not available**

- Attempt an APU start
- . If APU start is unsuccessful, a windmilling relight can be performed, as long as the speed is above 260 kt (corresponding N2 above 18 %). In this case, increase the aircraft speed and disregard VMO warning.

■ **If APU is available**
: perform an assisted relight, when below FL 200.

- Flight controls are in direct laws. Use manual pitch trim as necessary (not indicated on PFD if APU GEN not available).

FLIGHT CONTROLS

Failure cases, which would normally lead to ALTN law, will degrade F/CTL laws down to DIRECT law, if the landing gear is extended.

FAILURE OF BOTH ENGINES

When both engines are failed, to ease the handling of all the different ECAM procedures resulting from this all engine flame out situation, it is recommended to use the ENG DUAL FAILURE QRH procedure, and if time permits, to clear the ECAM.
Follow all the steps of the QRH procedure, except those that are modified by the procedure below :

■ **If APU is not available**

- Attempt an APU start
- . If APU start is unsuccessful, a windmilling relight can be performed, as long as the speed is above 260 kt (corresponding N2 above 18 %). In this case, increase the aircraft speed and disregard VMO warning.

■ **If APU is available**

: perform an assisted relight, when below FL 200.

- Flight controls are in direct laws. Use manual pitch trim as necessary (not indicated on PFD if APU GEN not available).

TAKEOFF

Ident.: PRO-NOR-SUP-LG-LG_DN-C-00021928.0006001 / 04 SEP 17
Applicable to: ALL

GENERAL

The recommended takeoff configuration is 1 + F, as this provides the best climb gradient.
It is not recommended to takeoff with tailwind.
To take into account the most limiting aspects of the takeoff, the second segment condition and the final segment condition are considered.
Once the takeoff weight determined, read the corresponding speeds in the RTOW chart.

Ident.: PRO-NOR-SUP-LG-LG_DN-C-00002006.0041001 / 04 SEP 17
5 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

SECOND SEGMENT CONDITIONS

The MTOW for a flight with gear down can be determined with use of the basic RTOW chart published for a normal flight.
To simplify calculations, a weight reduction percentage is applied for each configuration, regardless of the limitation. This weight reduction takes into account the most critical case which is obstacle clearance.

Takeoff configuration	1 + F	2	3
Weight reduction	14 %	12 %	10 %

MTOW DETERMINATION

Enter the basic RTOW chart with the runway conditions (temperature, pressure, etc.) desired aircraft configuration, and obtain the basic MTOW.
Obtain the weight reduction percentage corresponding to the desired takeoff configuration from the above table.

Reduce the previous basic MTOW by this percentage to obtain the MTOW, limited by the second segment condition.

FLIGHT PLANNING

Ident.: PRO-NOR-SUP-LG-LG_DN-00002011.0001001 / 04 SEP 17
Applicable to: ALL

GENERAL

Flying with the gear down induces additional drag and therefore deteriorates aircraft performance. This drag affects all phases of the flight where the landing gear is normally retracted.

MAXIMUM TAKEOFF WEIGHT DETERMINATION

The MTOW for the flight with gear down is determined by keeping the lowest of the weights given by:

- The second segment condition
- The final segment condition
- The en-route conditions
- The go-around conditions.

To determine the MTOW for a flight with the gear down, perform all following steps:

1. Determine the MTOW limited by the second segment condition (*Refer to PRO-NOR-SUP-LG-LG_DN Second Segment Conditions*).
2. Determine the MTOW limited by the final segment condition (*Refer to PRO-NOR-SUP-LG-LG_DN Final Segment Conditions*).
3. Keep the lowest of the above weights as the MTOW.
4. With the MTOW determined in step 3, check the obstacle clearance along the planned route (en-route).

   To determine the One Engine Inoperative (OEI) obstacle clearance:
   - *Refer to PRO-NOR-SUP-LG-LG_DN Driftdown Net Flight Path - One Engine Inoperative*
   - *Refer to PRO-NOR-SUP-LG-LG_DN Gross Ceilings - One Engine Inoperative*.

   If necessary, reduce the takeoff weight, in order to obtain the appropriate obstacle clearance.
5. Determine the go-around limiting weight (*Refer to PRO-NOR-SUP-LG-LG_DN Go-Around*). If necessary, reduce the MTOW to comply with this requirement.
6. Keep the lowest MTOW from steps 3, 4, and 5.

FLIGHT PLAN

The flight planning can be performed with the use of the tables provided in this procedure, or with a planning software (PEP, FlySmart, etc.).

FUEL BURN CORRECTION

The climb, cruise, and descent tables are determined for ISA conditions. For each degree Celsius above ISA and per nautical mile of air distance, add a fuel burn correction of 0.05 kg/°C/NM air distance (0.11 lb/°C/NM air distance).

CLIMB

Climb at 230 kt/M 0.50 with the use of maximum climb thrust.
Refer to PRO-NOR-SUP-LG-LG_DN Climb.

CRUISE

The recommended cruise speed is 230 kt/M 0.50.
Refer to PRO-NOR-SUP-LG-LG_DN Cruise.

HOLDING

The holding configuration is CONF 1.
Refer to PRO-NOR-SUP-LG-LG_DN Holding.

DESCENT

The recommended descent speed is 230 kt/M 0.50.
Refer to PRO-NOR-SUP-LG-LG_DN Descent.

GO-AROUND

Refer to PRO-NOR-SUP-LG-LG_DN Go-Around.

LANDING

The landing is standard.

ENGINE FAILURE

In case of engine failure, select maximum continuous thrust (MCT) on the remaining engine and adopt the specified driftdown speed.

For obstacle clearance and depending on the chosen strategy:
- *Refer to PRO-NOR-SUP-LG-LG_DN Driftdown Net Flight Path - One Engine Inoperative*
- *Refer to PRO-NOR-SUP-LG-LG_DN Gross Ceilings - One Engine Inoperative*.

Note: The OEI required obstacle clearances are 1 000 ft in climb or level flight, and 2 000 ft in descent.

For fuel burn calculations with one engine inoperative and landing gear down, use the standard OEI cruise fuel flow and apply the fuel penalty as per QRH/OPERATIONAL DATA/FUEL PENALTY FACTORS.

Operation with Nosewheel Steering Offset

OPERATION WITH NOSEWHEEL STEERING OFFSET

Applicable to: ALL

Ident.: PRO-NOR-SUP-LG-LG-A-00020945.0001001 / 17 MAR 17

During taxi in a straight line, the crew may notice aircraft veering tendency. This can be due to external conditions (crosswind, slope....), or to a nosewheel steering offset.
A nosewheel steering offset is usually notified through consecutive crew reports. The NWS offset value is determined regarding the necessary rudder trim input used to cancel the veering tendency.

Ident.: PRO-NOR-SUP-LG-LG-A-00020946.0001001 / 17 MAR 17

When the NWS offset is within admissible limits, the flight crew can operate the aircraft as follows:

CAUTION	A rudder trim reset must be performed before takeoff. When the rudder trim adjustment is above the maintenance tolerance (±0.5 ° NWS offset corresponding to ±3 ° rudder trim necessary to taxi straight), the flight crew must systematically and accurately report the rudder trim value in the logbook.

NWS Offset	Necessary Rudder Trim Input	Procedure
Offset ≤ 0.5 °	Trim ≤ 3 °	● **Taxi:** RUDDER TRIM.....ADJUST Adjust trim until the aircraft taxies in a straight line. Check input value. ● **Before takeoff:** RUDDER TRIM.....RESET
0.5 ° < Offset ≤ 1.5 °	3 ° < Trim ≤ 8.8 °	● **Taxi:** RUDDER TRIM.....ADJUST Adjust trim until the aircraft taxies in a straight line. Check input value. ● **Before takeoff:** RUDDER TRIM.....RESET ● **Landing:** ● **For autoland:** MAX CROSSWIND.....10 kt
Offset > 1.5 °	Trim > 8.8 °	MAINTENANCE ACTION.....REQUEST Do not attempt takeoff. Request for troubleshooting.

Intentionally left blank

Pushback with Power Push Unit

PUSHBACK WITH POWER PUSH UNIT VIA THE MAIN LANDING GEAR

Ident.: PRO-NOR-SUP-MISC-D-A-00020472.0002001 / 28 NOV 17
Applicable to: ALL

When pushback is performed with a Power Push Unit (PPU) via the main landing gear, this procedure replaces the BEFORE PUSHBACK OR START SOP.

- **Before start clearance**

SOP - BEFORE START CLEARANCE.....PERFORM

L2 *Refer to PRO-NOR-SOP-07 Before Start Clearance.*

L1 BEFORE START CHECKLIST down to the line.....COMPLETE
NW STRG DISC MEMO.....CHECK NOT DISPLAYED

L2 *The ground crew should check that the towing lever is in the normal position.*

L1 - **At start clearance**

PUSHBACK/START CLEARANCE.....OBTAIN

L2 *Obtain ATC pushback/start clearance.*
Obtain ground crew clearance.

L1 ATC.....SET FOR OPERATION

L2 *ATC is set in accordance with airport requirements.*

L1 WINDOWS AND DOORS.....CHECK CLOSED

L2 *- To ensure that the sliding window is correctly closed, push the handle of the sliding window fully forward to the closed position, and check that the red indicator is visible.*
- Check, on the ECAM lower display, that all the aircraft doors are closed.
- When required by local airworthiness authorities, check that the cockpit door is closed and locked (no cockpit door open/fault indication).
If entry is requested, identify the person requesting entry before unlocking the door. With the cockpit door sw on NORM, the cockpit door is closed and locked. If entry is requested from the cabin, and if no further action is performed by the pilot, the cabin crew will be able to unlock the door by using the emergency access procedure. Except for crew entry/exit, the cockpit door should remain closed until engine shutdown.

L1 SLIDES.....CHECK ARMED

L2 *- Check, on the ECAM lower display, that all slides are armed.*

L1 BEACON sw.....ON

THRUST LEVERS.....IDLE

CAUTION	*Engines will start, regardless of the thrust lever position; thrust will rapidly increase to the corresponding thrust lever position, causing a hazardous situation, if thrust levers are not at IDLE.*

ACCU PRESS indicator.....CHECK

L2 *The ACCU PRESS indication must be in the green band. If required, use the electric pump on yellow hydraulic system to recharge the brake accumulator.*

L1 PARK BRK handle.....CHECK ON
BRAKES PRESS indicator..... CHECK

L2 *Check for normal indication.*

L1 BEFORE START CHECKLIST below the line..... COMPLETE

Ident.: PRO-NOR-SUP-MISC-D-A-00020473.0002001 / 17 MAR 17
1 **Applicable to: MSN 02443-02457, 02584-09063**

ENG 2..... START

L2 *Engine 2 is usually started first to pressurize the yellow hydraulic system, making the nosewheel steering and parking brake available.*

Ident.: PRO-NOR-SUP-MISC-D-A-00020473.0001001 / 17 MAR 17
Applicable to: MSN 01767-02405, 02482

ENG 2..... START

L2 *Engine 2 is usually started first to pressurize the yellow hydraulic system, making the parking brake available.*

L1 PTU..... CHECK AUTO

L2 *The green hydraulic system is pressurized via PTU, making the nosewheel steering available.*

Ident.: PRO-NOR-SUP-MISC-D-A-00020474.0001001 / 17 MAR 17
Applicable to: ALL

PUSHBACK

Due to a face-to-face situation between the ground personnel and the flight crew, a clear understanding of directional phraseology is essential.

PARK BRK handle.....OFF
BRAKES PRESS indicator.....CHECK ZERO

L2 *A slight residual pressure may remain for a short period of time on the triple indicator. Advise the ground crew that the parking brake is off and that the pushback can be started.*

L1

CAUTION	*Do not use the brakes during pushback, except in case of emergency.* *Do not move flight controls or flap lever.*

L2 *In case of emergency, order the ground crew to separate the PPU and move it away from the evacuation areas. Nevertheless, evacuation is possible with the PPU in place.*

L1 STEERING HANDWHEEL.....AS REQUIRED

L2 *Steer the aircraft using guidance from the ground crew.*

L1 ● **When pushback is completed:**

PARK BRK handle.....ON
BRAKES PRESS indicator..... CHECK
GROUND CREW..... ADVISED TO REMOVE PPU

● **When PPU is removed and ground crew clearance obtained:**

ENG 1.....START
SOP - AFTER START..... RESUME

Refer to PRO-NOR-SOP-09 After Start

Intentionally left blank

High Altitude Airport Operations

HIGH ALTITUDE AIRPORT OPERATIONS

Ident.: PRO-NOR-SUP-MISC-A-A-00020648.0002001 / 20 MAR 17
Applicable to: MSN 02204

CAB PRESS SYSTEM

- **If the CAB PR EXCESS CAB ALT alert triggers:**

L2 - During descent (when cabin altitude is above 9 550 ft ± 350).
- On ground after electrical power application (if cabin altitude is above 9 550 ft ± 350).

L1 Use the «CLR pb» to cancel the alert.

HYD SYSTEM

- **If the HYD Y(B)(G) RSVR LO AIR PR alert triggers on ground:**
  Before engine start: SWITCH OFF AFFECTED HYD PUMP.

Ident.: TDU / PRO-NOR-SUP-MISC-A-A-00021551.0022001 / 05 JUN 18
Applicable to: MSN 03750
Impacted DU: 00020650 Operation at or Above 9 200 ft

TAKEOFF ON AIRPORT WITH AN ELEVATION OF 9 200 FT OR ABOVE

COCKPIT PREPARATION

HIGH ALT LDG pb-sw (for all on ground operation).....ON

BEFORE PUSHBACK OR START

ACCU PRESS..... CHECK

L2 If required, use the HYD YELLOW ELEC PUMP to recharge the brake accumulator.

L1 GEN 1..... OFF
GEN 2..... OFF
G ENG PUMP.....OFF
Y ENG PUMP..... OFF

ENGINE START

- **When idle is reached**
  GEN 1..... ON
  GEN 2..... ON
  G ENG PUMP.....ON
  Y ENG PUMP..... ON

TAKEOFF

Note: For A/C operating under FAA requirements, as long as the cabin altitude is above 12 000 ft in flight, at least one pilot must use the oxygen mask continuously.

APU BLEED..... AS RQRD

L2 Packs may be supplied for takeoff by the engine bleed, or by the APU bleed up to 17 000 ft depending on the takeoff performance requirement.

L1 **CRUISE**

LDG ELEV AUTO [CRUISE page].....CHECK

- **When cabin altitude below 12 000 ft and decreasing:**
  HIGH ALT LDG pb-sw..... OFF
  CHECK THAT CABIN ALTITUDE DECREASES BELOW 9 550 ft +/- 350 ft

L2 This will allow the CAB PR EXCESS CAB ALT alert to trigger again if necessary despite the clear action.

L1 **LANDING ON AIRPORTS WITH AN ELEVATION OF 9 200 FT OR ABOVE**

CRUISE

- **If CAB ALT exceeds 8 000 ft:**
  LDG ELEV: 8 000 ft:..... SET

L2 Manually selecting a landing field elevation overrides the FMGS landing field elevation for the remaining time of cruise.

L1 *Note: A step descent or turbulence conditions may trigger an early CPC descent mode detection, leading the CPC to start controlling to the landing field elevation pressure.*

DESCENT PREPARATION

Note: For A/C operating under FAA requirements, at least one pilot must use the oxygen mask continuously until landing.

HIGH ALT LDG pb-sw.....ON

L2 Passengers oxygen masks would drop when cabin altitude is above 14 000 ft +250/-750 ft if HIGH ALT LDG pushbutton switch is OFF.

L1 *Note: Passengers oxygen masks drop above 16 000 ft +250/-750 ft cabin altitude if HIGH ALT LDG pushbutton switch is ON.*

LDG ELEV.....AUTO

L2 CPC starts controlling the pressure to the landing field elevation at beginning of descent.

L1 **DESCENT**

- **After descent initiation when cabin altitude has reached 8 500 ft :**
  MODE SEL pb.....MAN
  MODE SEL pb.....AUTO

  Note: CPC changeover after descent initiation will force the CPC in standby mode to become operational in cruise mode and to limit the cabin altitude to 8 000 ft.

AFTER LANDING

HIGH ALT LDG pb-sw (for all on ground operation).....ON

Impacted DU: 00020650 Operation at or Above 9 200 ft

TAKEOFF ON AIRPORT WITH AN ELEVATION OF 9 200 FT OR ABOVE

TAKEOFF

Note: For A/C operating under FAA requirements, as long as the cabin altitude is above 12 000 ft in flight, at least one pilot must use the oxygen mask continuously.

APU BLEED..... AS RQRD

Depending on the takeoff performance requirements, both engine bleeds can be set to OFF, and;
- Both packs running, supplied by APU bleed up to 17 000 ft.
- One pack running, supplied by APU bleed up to 20 000 ft.

CRUISE

LDG ELEV AUTO [CRUISE page].....CHECK

LANDING ON AIRPORTS WITH AN ELEVATION OF 9 200 FT OR ABOVE

CRUISE

- **If CAB ALT exceeds 8 000 ft:**
  LDG ELEV: 8 000 ft:..... SET

L2 Manually selecting a landing field elevation overrides the FMGS landing field elevation for the remaining time of cruise.

L1 *Note: A step descent or turbulence conditions may trigger an early CPC descent mode detection, leading the CPC to start controlling to the landing field elevation pressure.*

DESCENT PREPARATION

Note: For A/C operating under FAA requirements, at least one pilot must use the oxygen mask continuously until landing.

HIGH ALT LDG pb-sw.....ON

L2 Passengers oxygen masks would drop when cabin altitude is above 14 000 ft +250/-750 ft if HIGH ALT LDG pushbutton switch is OFF.

L1 *Note: Passengers oxygen masks drop above 16 000 ft +250/-750 ft cabin altitude if HIGH ALT LDG pushbutton switch is ON.*

LDG ELEV.....AUTO

L2 CPC starts controlling the pressure to the landing field elevation at beginning of descent.

L1 **DESCENT**

- **After descent initiation when cabin altitude has reached 8 500 ft :**
  MODE SEL pb.....MAN
  MODE SEL pb.....AUTO

  Note: CPC changeover after descent initiation will force the CPC in standby mode to become operational in cruise mode and to limit the cabin altitude to 8 000 ft.

APPROACH

- **If performance requires:**

  Approach can be performed with both engine bleeds set to OFF, and:
  - Both packs supplied by APU bleed below 17 000 ft, or
  - One single pack supplied by APU bleed below 20 000 ft.

GEN 2 ..... OFF
G ENG PUMP ..... OFF
Y ENG PUMP ..... OFF

ENGINE START

- **When idle is reached**

  GEN 1 ..... ON
  GEN 2 ..... ON
  G ENG PUMP ..... ON
  Y ENG PUMP ..... ON

TAKEOFF

Note: For A/C operating under FAA requirements, as long as the cabin altitude is above 12 000 ft in flight, at least one pilot must use the oxygen mask continuously.

APU BLEED ..... AS RQRD

L2 Packs may be supplied for takeoff by the engine bleed, or by the APU bleed up to 17 000 ft depending on the takeoff performance requirement.

L1 **CRUISE**

LDG ELEV AUTO [CRUISE page] ..... CHECK

- **When cabin altitude below 12 000 ft and decreasing:**

  HIGH ALT LDG pb-sw ..... OFF
  CHECK THAT CABIN ALTITUDE DECREASES BELOW 9 550 ft +/- 350 ft

L2 This will allow the CAB PR EXCESS CAB ALT alert to trigger again if necessary despite the clear action.

L1 **LANDING ON AIRPORTS WITH AN ELEVATION OF 9 200 FT OR ABOVE**

CRUISE

- **If CAB ALT exceeds 8 000 ft:**

  LDG ELEV: 8 000 ft ..... SET

L2 Manually selecting a landing field elevation overrides the FMGS landing field elevation for the remaining time of cruise.

L1 *Note: A step descent or turbulence conditions may trigger an early CPC descent mode detection, leading the CPC to start controlling to the landing field elevation pressure.*

DESCENT PREPARATION

Note: For A/C operating under FAA requirements, at least one pilot must use the oxygen mask continuously until landing.

HIGH ALT LDG pb-sw.....ON

L2 Passengers oxygen masks would drop when cabin altitude is above 14 000 ft +250/-750 ft if HIGH ALT LDG pushbutton switch is OFF.

L1 *Note: Passengers oxygen masks drop above 16 000 ft +250/-750 ft cabin altitude if HIGH ALT LDG pushbutton switch is ON.*

LDG ELEV.....AUTO

L2 CPC starts controlling the pressure to the landing field elevation at beginning of descent.

L1 **AFTER LANDING**

HIGH ALT LDG pb-sw (for all on ground operation).....ON

TAKEOFF ON AIRPORT WITH AN ELEVATION OF 9 200 FT OR ABOVE

TAKEOFF

Note: For A/C operating under FAA requirements, as long as the cabin altitude is above 12 000 ft in flight, at least one pilot must use the oxygen mask continuously.

APU BLEED.....AS RQRD

Depending on the takeoff performance requirements, both engine bleeds can be set to OFF, and;
- Both packs running, supplied by APU bleed up to 17 000 ft.
- One pack running, supplied by APU bleed up to 20 000 ft.

CRUISE

LDG ELEV AUTO [CRUISE page].....CHECK

LANDING ON AIRPORTS WITH AN ELEVATION OF 9 200 FT OR ABOVE

CRUISE

- **If CAB ALT exceeds 8 000 ft:**
  LDG ELEV: 8 000 ft.....SET

L2 Manually selecting a landing field elevation overrides the FMGS landing field elevation for the remaining time of cruise.

L1 *Note: A step descent or turbulence conditions may trigger an early CPC descent mode detection, leading the CPC to start controlling to the landing field elevation pressure.*

DESCENT PREPARATION

Note: For A/C operating under FAA requirements, at least one pilot must use the oxygen mask continuously until landing.

HIGH ALT LDG pb-sw.....ON

L2 Passengers oxygen masks would drop when cabin altitude is above 14 000 ft +250/-750 ft if HIGH ALT LDG pushbutton switch is OFF.

L1 *Note: Passengers oxygen masks drop above 16 000 ft +250/-750 ft cabin altitude if HIGH ALT LDG pushbutton switch is ON.*

LDG ELEV.....AUTO

L2 CPC starts controlling the pressure to the landing field elevation at beginning of descent.

L1 **APPROACH**

- **If performance requires:**

  Approach can be performed with both engine bleeds set to OFF, and:
  - Both packs supplied by APU bleed below 17 000 ft, or
  - One single pack supplied by APU bleed below 20 000 ft.

Intentionally left blank

Operations at QNH Above 1050 hPa

GENERAL

Ident.: PRO-NOR-SUP-MISC-C-00002100.0026001 / 21 MAR 17

1 **Applicable to: MSN 01957-02097, 02121, 02138, 02204-02334, 02443-02457, 02649-02670, 02737-03071, 03264, 03330, 04491, 04532, 04645, 04965-06336**

Operators may occasionally experience high barometric settings above 1 050 hPa (31.0 inHg), due to polar anticyclonic air mass conditions. These conditions mainly occur during winter in the upper northern region.
The FCU, ISIS, PFD, and CPCS are capable of operating at QNH/QFE up to 1 100 hPa (32.48 hPa).
The FMGS is currently limited to 1 050 hPa for DEST QNH entry on the MCDU PERF APPR page.
Due to engine limitations on the nacelle and thrust reverser, the flight envelope is limited to -1 000 ft STD. Therefore, for departure and arrival, the flight crew must ensure that the aircraft remains within its flight envelope.

CAUTION	When the QNH exceeds 1 050 hPa, the aircraft standard altitude might be outside of its flight envelope (below -1 000 ft STD), depending on the airfield elevation. Operations at QNH above 1 050 hPa are only authorized within the flight envelope of the aircraft.

EXAMPLE

- Airfield Elevation : 400 ft
- QNH : 1 058 hPa

- We approximately consider that 1 hPa = 27 ft

Determination of the flight level of this aircraft :
- (QNH - 1013.25) x 27 + Airfield Elevation = - (1058-1013.25) x 27+ 400 = -808 ft
In this example, during takeoff or landing the aircraft is within the flight envelope at an altitude of: -808 ft STD > -1 000 ft STD.
Therefore with these conditions, operations at QNH = 1 058 hPa are authorized.

GENERAL

Ident.: PRO-NOR-SUP-MISC-C-00002100.0023001 / 21 MAR 17
Applicable to: MSN 02108, 02135, 02139-02195, 02359, 02405, 02482, 02609-02626, 03308, 03357-03618, 03782-04216, 04312, 04328-04384, 04481-04488, 04506, 04518, 04535-04637, 04752-04954

Operators may occasionally experience high barometric settings above 1 050 hPa (31.0 inHg), due to polar anticyclonic air mass conditions. These conditions mainly occur during winter in the upper northern region.
The FCU, PFD, and CPCS are capable of operating at QNH/QFE up to 1 100 hPa (32.48 inHg).

The standby altimeter barometric setting is limited to 1 050 hPa.
The FMGS is currently limited to 1 050 hPa for DEST QNH entry on the MCDU PERF APPR page.
Due to engine limitations on the nacelle and thrust reverser, the flight envelope is limited to -1 000 ft STD. Therefore, for departure and arrival, the flight crew must ensure that the aircraft remains within its flight envelope.

CAUTION	When the QNH exceeds 1 050 hPa, the aircraft standard altitude might be outside of its flight envelope (below -1 000 ft STD), depending on the airfield elevation. Operations at QNH above 1 050 hPa are only authorized within the flight envelope of the aircraft.

EXAMPLE

- Airfield Elevation : 400 ft
- QNH : 1 058 hPa

- We approximately consider that 1 hPa = 27 ft

Determination of the flight level of this aircraft :
- (QNH - 1013.25) x 27 + Airfield Elevation = - (1058-1013.25) x 27+ 400 = -808 ft
In this example, during takeoff or landing the aircraft is within the flight envelope at an altitude of: -808 ft STD > -1 000 ft STD.
Therefore with these conditions, operations at QNH = 1 058 hPa are authorized.

GENERAL

Ident.: PRO-NOR-SUP-MISC-C-00002100.0008001 / 03 FEB 11
Applicable to: MSN 01767

Some airlines may occasionally experience high barometric correction settings above 1 050 hPa, or 31.0 inHg on some airfields, due to polar anticyclonic air mass conditions occuring near the polar area during winter.
The FMS, FCU, PFD, and CPCS are capable of operating at QNH/QFE up to 1 100 hPa, or 32.48 inHg.
The standby altimeter barometric setting is also limited to 1 050 hPa. In addition, the ATC/TCAS operates only up to 1 050 hPa (that is as long as the aircraft altitude remains above -1 000 ft standard pressure altitude).
Therefore, when using QNH, or QFE for QFE pin-programmed aircraft, for departure and arrival, the crew should be aware of the following consequences, and should apply the following procedures.
It is necessary for the airline to obtain operational approval from its national airworthiness authorities.

Some airlines may occasionally experience high barometric correction settings above 1 050 hPa, or 31.0 inHg on some airfields, due to polar anticyclonic air mass conditions occuring near the polar area during winter.
The FMS, FCU, ISIS instrument, PFD, and CPCS are capable of operating at QNH/QFE up to 1 100 hPa, or 32.48 inHg.
However, the ATC/TCAS operates only up to 1050 hPa (i.e. as long as the aircraft altitude remains above –1000 feet standard pressure altitude).
Therefore, when using QNH, or QFE for QFE pin-programmed aircraft, for departure and arrival, the crew should be aware of the following consequences, and should apply the following procedures.
It is necessary for the airline to obtain operational approval from its national airworthiness authorities.

CONSEQUENCES

Ident.: PRO-NOR-SUP-MISC-C-00002102.0076001 / 23 JUN 15
2 **Applicable to: MSN 02097, 02121, 02138, 02204-02334, 02443-02457, 02649-02670, 02737-02914, 04491, 04532, 04645, 05120, 05158, 05218**

ON CABIN PRESSURIZATION:

The CPCS normally uses the MCDU DEST QNH value to regulate cabin pressure during descent. However, since DEST QNH entries on the MCDU are limited to 1 050 hPa, no DEST QNH value should be entered during descent preparation, in order to avoid incorrect cabin pressure regulation. As a backup, the CPCS will use the actual FCU barometric setting (when switching from STD to Baro reference). In case of QFE use at arrival, the CPCS will erroneously use the FCU-selected QFE as a QNH setting. To ensure correct re-pressurization of the cabin when QFE is used, the Landing Field Elevation must be manually set to 0.

Note: As no DEST QNH is entered, the FMS initially assumes that Standard barometric reference will be kept down to destination for descent flight path calculations.
When QNH is set on the FCU, the aircraft and cabin altitude will be higher than expected (the aircraft altitude can be up to 2 000 ft higher than expected). This will lead to a higher descent rate, with a possible "CAB PR LO DIFF PR" ECAM caution, and possible opening of the cabin pressure safety valve.

ON THE FMS:

- Descent profile :
  In the descent phase, when the crew switches from Standard to Barometric reference, the FMS tries to catch up with an altitude increase induced by the baro reference change.
  This altitude difference may be up to +2 000 ft, depending on the QNH value.
  However, the FMS predictions and the VDEV remain unchanged. Consequently, an altitude constraint, just below the Descent Transition Level, may still be predicted as “satisfied”, and actually flown with a positive error. This altitude difference will gradually be zeroed, as the aircraft catches up with the descent profile.

  Note: *As no DEST QNH value is entered on the MCDU PERF APPR page, the FMS is unable to compute the Descent Transition Level. So, the “STD” baro reference on the PFD will not flash when descending through the Transition Level.*

CONSEQUENCES

1 084	1 049	900
1 085	1 047	1 000
1 086	1 048	1 000
1 087	1 049	1 000
1 088	1 050	1 000
1 089	1 047	1 100

Standby Altitude Correction Tables

HOW TO USE

Set the baro reference of the standby altimeter to the appropriate value. Then :

- To obtain the correct altitude, add the correction to the altimeter indication.
- To fly at a desired altitude, subtract the correction from the desired altitude.

EXAMPLE

If the QNH of the day is 1 072 hPa, the baro setting on the standby altimeter would be 1 049 hPa. When reading an altitude on the standby altimeter, it is necessary to add 600 ft to obtain the actual altitude of the aircraft.

Therefore, in this example, the indicated altitude on the standby altimeter should be 1 400 ft, in order to fly at 2 000 ft QNH.

PROCEDURES

BEFORE TAKEOFF

ALT RPTG ..... OFF

L2 *ALT RPTG OFF memo and TCAS STBY memo appear on the WD.*

L1 ATC..... NOTIFY

L2 *Notify the ATC that the altitude reporting is not available.*

L1 TAKEOFF

- **Above 1 000 ft, when time permits:**

  ALT RPTG ..... ON

L2 *As a result, the TCAS automatically reverts to its previous setting.*

L1 DESCENT PREPARATION

DO NOT INSERT a DEST QNH value on the MCDU PERF APPR page.

- **For QFE use:**

  LDG ELEV ..... SET TO 0

APPROACH

- **Before final approach:**

  ATC..... NOTIFY

L2 *Notify the ATC that the altitude reporting will be turned off.*

L1 ALT RPTG ..... OFF

Note: Perform non-precision approaches using selected lateral and vertical guidance, and raw data reference.

PROCEDURES

Ident.: PRO-NOR-SUP-MISC-C-00002104.0022001 / 20 MAR 17
Applicable to: MSN 02108, 02135, 02139-02195, 02359, 02405, 02482, 02609-02626, 03308, 03357-03618, 03782-04216, 04312, 04328-04384, 04481-04488, 04506, 04518, 04535-04637, 04752-04954

BEFORE TAKEOFF

[STBY ALTIMETER] BARO SETTING..... SET

See Standby Altitude Correction Tables.

USE THE CORRECTION VALUE FOR ALTITUDE READINGS

To obtain the correct altitude flown by the aircraft, add the correction value to the standby altimeter indication.

DESCENT PREPARATION

DO NOT INSERT a DEST QNH value on the MCDU PERF APPR page.

- **For QFE use:**
  LDG ELEV ..... SET TO 0

DESCENT

- **When approaching transition level:**
  [STBY ALTIMETER] BARO SETTING..... SET

  See Standby Altitude Correction Tables.

  USE THE CORRECTION VALUE FOR ALTITUDE READINGS

PROCEDURES

Ident.: PRO-NOR-SUP-MISC-C-00002104.0008001 / 20 MAR 17
Applicable to: MSN 01767

BEFORE TAKEOFF

[STBY ALTIMETER] BARO SETTING..... SET

See Standby Altitude Correction Tables.

USE THE CORRECTION VALUE FOR ALTITUDE READINGS

To obtain the correct altitude flown by the aircraft, add the correction value to the standby altimeter indication.

ALT RPTG ..... OFF

L2 *ALT RPTG OFF memo and TCAS STBY memo appear on the WD.*

L1 ATC..... NOTIFY

L2 *Notify the ATC that the altitude reporting is not available.*

L1 **TAKEOFF**

- **Above 1 000 ft, when time permits:**
  ALT RPTG ..... ON

L2 *As a result, the TCAS automatically reverts to its previous setting.*

L1 **DESCENT**

- **When approaching transition level:**
  [STBY ALTIMETER] BARO SETTING..... SET
  See Standby Altitude Correction Tables.
  USE THE CORRECTION VALUE FOR ALTITUDE READINGS

APPROACH

- **Before final approach:**
  ATC..... NOTIFY

L2 *Notify the ATC that the altitude reporting will be turned off.*

L1 ALT RPTG ..... OFF

PROCEDURES

Ident.: PRO-NOR-SUP-MISC-C-00002104.0015001 / 20 MAR 17
Applicable to: MSN 02712, 03138, 03750, 04294, 04314, 04393-04438, 04510

BEFORE TAKEOFF

ALT RPTG ..... OFF

L2 *ALT RPTG OFF memo and TCAS STBY memo appear on the WD.*

L1 ATC..... NOTIFY

L2 *Notify the ATC that the altitude reporting is not available.*

L1 **TAKEOFF**

- **Above 1 000 ft, when time permits:**
  ALT RPTG ..... ON

L2 *As a result, the TCAS automatically reverts to its previous setting.*

L1 **APPROACH**

- **Before final approach:**
  ATC..... NOTIFY

L2 *Notify the ATC that the altitude reporting will be turned off.*

L1 ALT RPTG ..... OFF

AUTOMATIC DEPENDENT SURVEILLANCE - BROADCAST (ADS-B)

Ident.: PRO-NOR-SUP-SURV-00020957.0001001 / 17 MAR 17

[1] **Applicable to: MSN 01920, 02135, 02139-02195, 02457, 02584-02626, 02670-02712, 02908-03071, 03357-03618, 03782-04216, 04312-04397, 04481-04506, 04518-05155, 05190-09063**

ADS-B OUT:

In some cases, the ATC ground stations can receive non valid data from the ADS-B function. Therefore, the air traffic controller may ask the flight crew to stop the transmission of the ADS-B data (e.g. the air traffic controller requests "STOP ADS-B TRANSMISSION" or "STOP ADS-B ALTITUDE TRANSMISSION").
The flight crew cannot switch off the ADS-B automatic data transmission independently of the XPDR.
Therefore, do not switch off the ATC transponder or the altitude reporting, in order to maintain TCAS operations or Air Traffic Controller radar surveillance.
In such cases, the flight crew must refer to local Aeronautical Information Publication (AIP) to apply alternate procedure when the air traffic controller requests to stop ADS-B transmission.

ADS-B IN:

The ATSAW ◁ enables the reception of ADS-B information from other aircraft in the vicinity. Refer to the ATSAW section.

ENHANCED GROUND PROXIMITY WARNING SYSTEM (EGPWS)

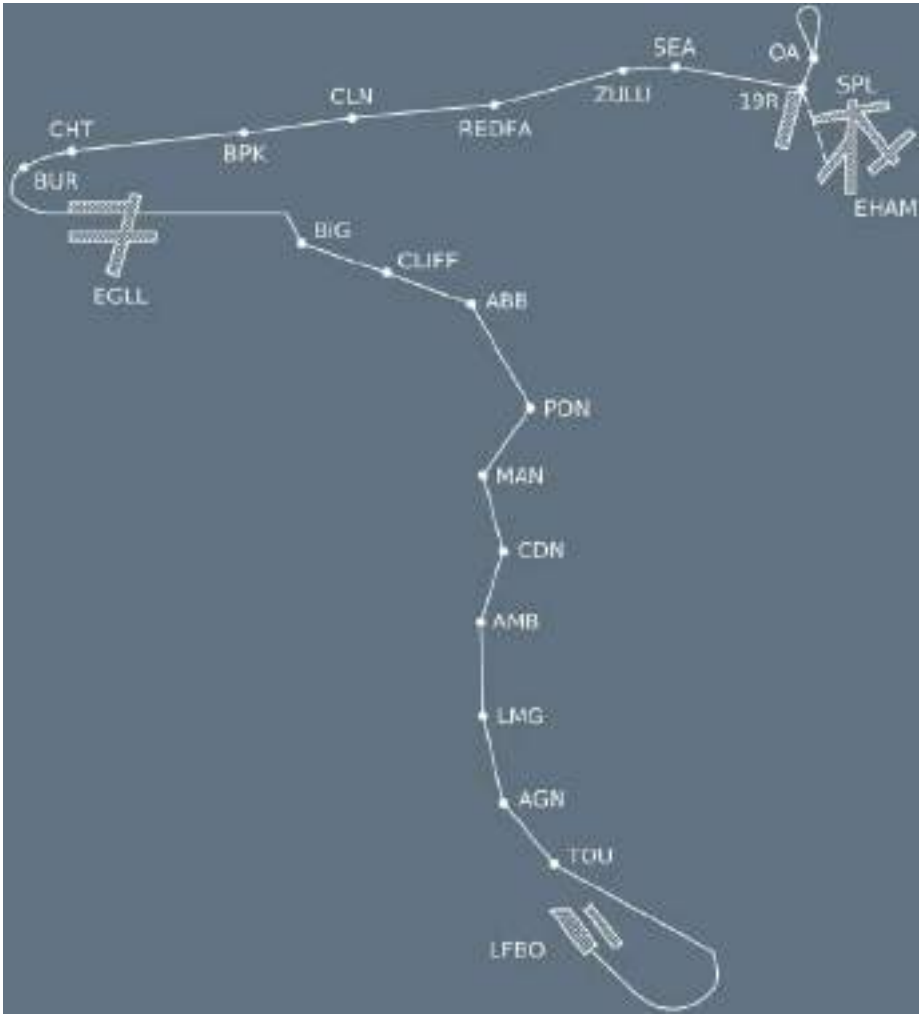
Ident.: PRO-NOR-SUP-SURV-00020960.0004001 / 17 MAR 17
Applicable to: MSN 01767-01920, 02108, 02195, 02275-02359, 02405, 02482, 02737-02804

During climb, descent, approach and go-around phases:

- **If GPS PRIMARY ◁ is not available and FMS navigation accuracy check prevents the flight crew from using NAV mode in a phase of flight:**
  TERR pb-sw.....OFF

  Note: When the TERR pb-sw is switched OFF, the ECAM message "NAV GPWS TERR DET FAULT" is displayed.
  Only the basic GPWS modes 1 to 5 remain operative.

Intentionally left blank



Introduction

INTRODUCTION

Cockpit Preparation

FMGS INITIALIZATION

Ident.: PRO-NOR-SRP-01-10-00003960.0002001 / 22 MAY 12

[1] **Applicable to: MSN 01767-01920, 02108, 02275-02334, 02388, 02457, 02584-02670, 02737-02804, 03750, 04491, 04532, 04645, 05120, 05218, 06720-09063**

CHECKING THE CLOCK DATE

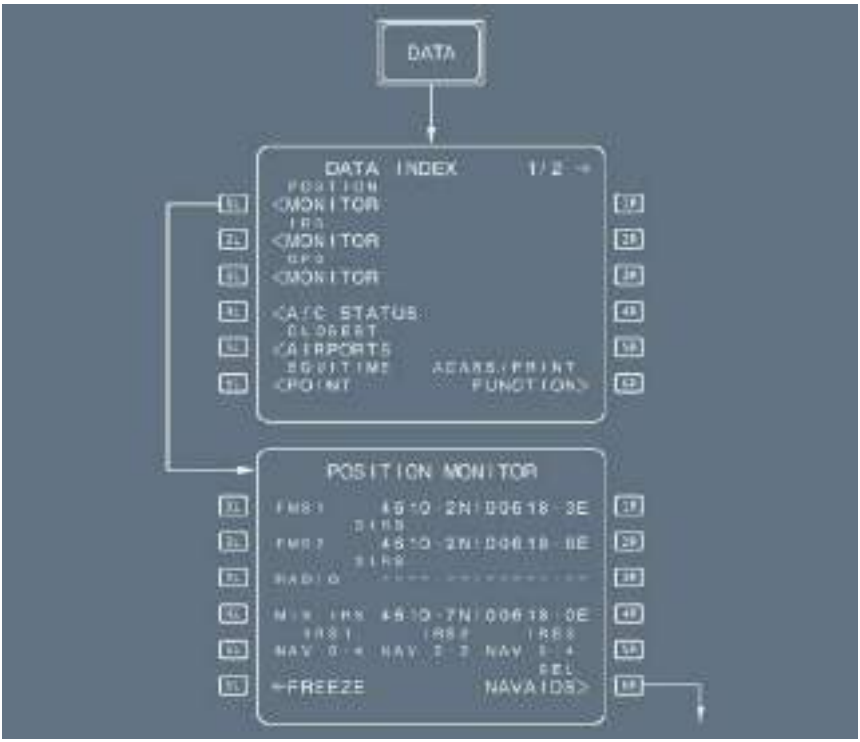
CHECK the CLOCK DATE and ADJUST, if necessary.

If the date in the active database does not match the clock date, the MCDU displays "CHECK DATA BASE CYCLE". If this message appears, check the period of validity in the second database and select it, if required.

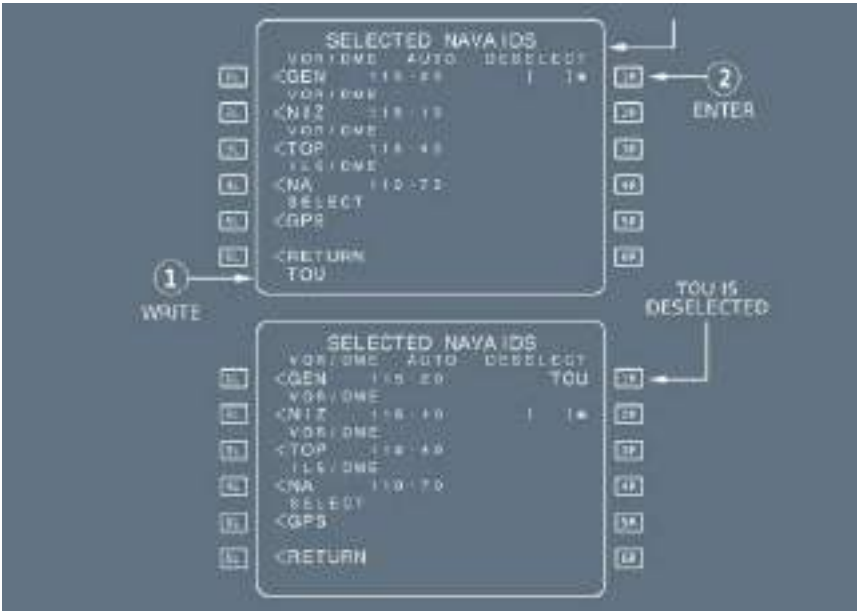
CAUTION	*Cycling the navigation database deletes the active and secondary flight plans. Do not cycle it while airborne because doing so will delete the flight plan, eliminate all speed predictions, and blank the ND. If the aircraft is in managed speed, Green Dot becomes the speed target.*

CHECKING STORED WAYPOINTS, NAVAIDS, RUNWAYS, OR ROUTES

PRESS the DATA key.
PRESS the next page key.



SELECT, successively, as required:
- STORED WAYPOINT
- STORED NAVAIDS
- STORED RUNWAYS
- STORED ROUTES



CHECK the contents of each of these data storages and DELETE items, as appropriate.

NAVAIDS DESELECTION

- **If NOTAMS indicate that selected NAVAIDs are unreliable or unserviceable, deselect them as follows:**
  PRESS the DATA key.
  SELECT the POSITION MONITOR page.
  SELECT the SELECTED NAVAIDS page.
  Under “DESELECT”, INSERT the NAVAID identifier in the brackets.

  The pilot can only make six deselections.

FMGS INITIALIZATION

Ident.: PRO-NOR-SRP-01-10-00003960.0008001 / 22 MAY 12

Applicable to: MSN 01957-02097, 02121-02204, 02359, 02405-02443, 02482, 02712, 02908-03618, 03782-04488, 04506-04518, 04535-04637, 04752-05094, 05155-05190, 05230-06336

CHECKING THE DATABASE CYCLE

CHECK the CLOCK DATE and ADJUST, if necessary.

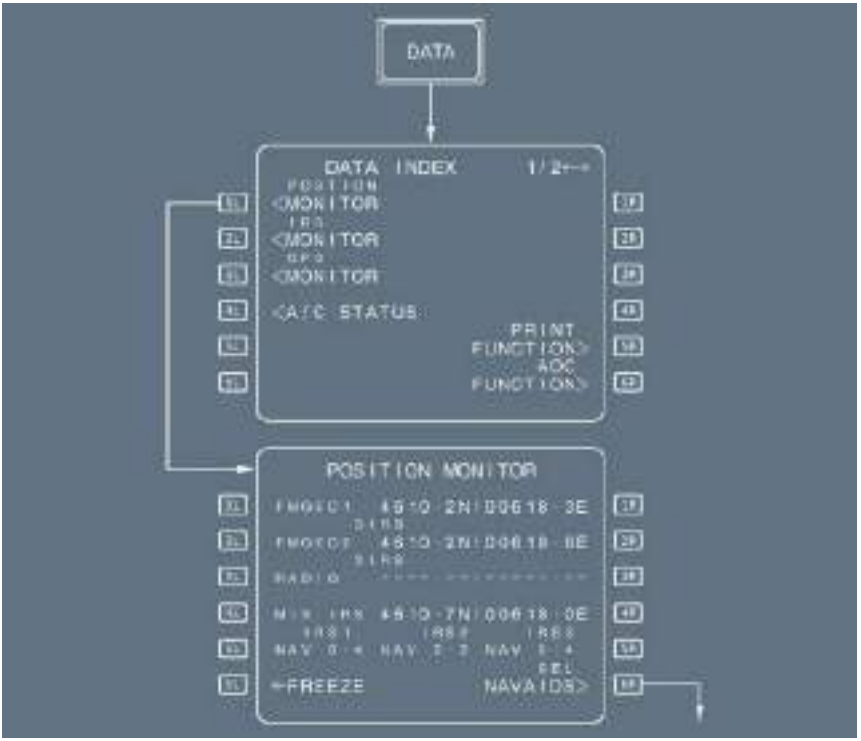
If the date in the active database does not match the clock date, the MCDU displays "CHECK DATA BASE CYCLE". If this message appears, check the period of validity in the second database and select it, if required.

CAUTION	*Cycling the navigation database deletes the active and secondary flight plans. Do not cycle it while airborne because doing so will delete the flight plan, eliminate all speed predictions, and blank the ND. If the aircraft is in managed speed, Green Dot becomes the speed target.*

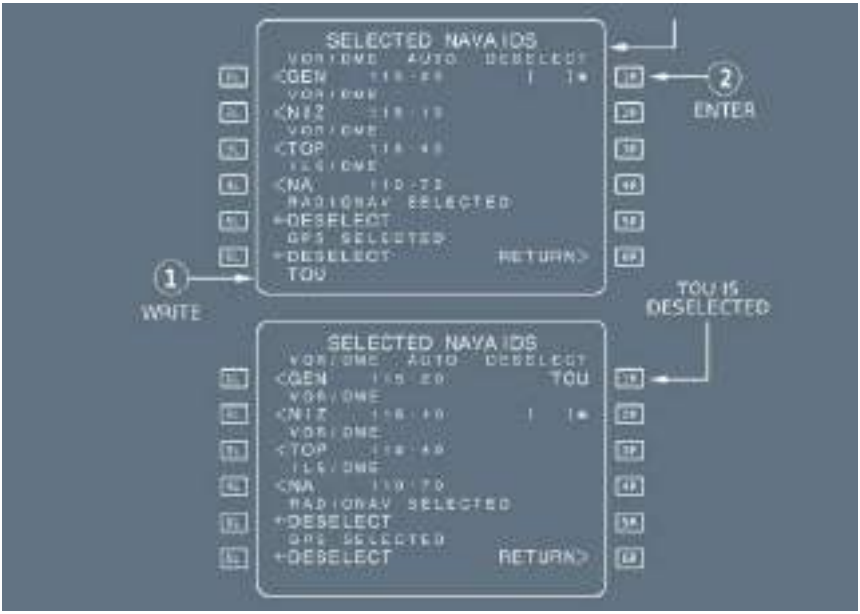
CHECKING PILOT'S WAYPOINTS, NAVAIDS, RUNWAYS, OR ROUTES

PRESS the DATA key.
PRESS the next page key.

SELECT, successively, as required:
- PILOTS WAYPOINTS
- PILOTS NAVAIDS
- PILOTS RUNWAYS
- PILOTS ROUTES



CHECK the contents of each of these data storages and DELETE items, as appropriate.



NAVAIDS DESELECTION

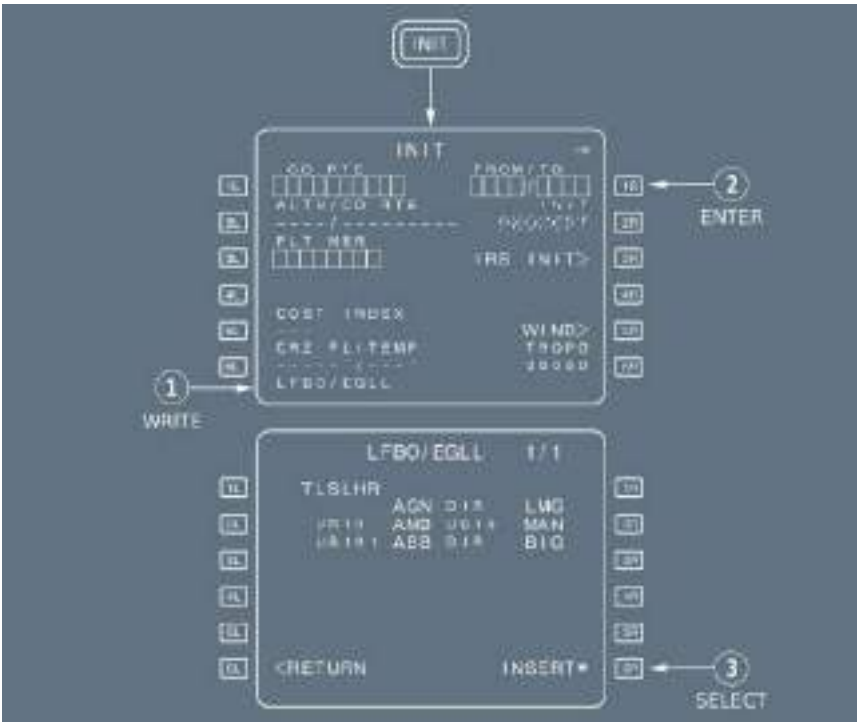
- **The flight crew can manually deselect all the RADIO NAVAIDs as follows:**
  PRESS the DATA key.
  SELECT the POSITION MONITOR page.
  SELECT the SELECTED NAVAIDS page.
  Press [5L] to DESELECT all the Radio NAVAIDs.

- **If NOTAMS indicate that selected NAVAIDs are unreliable or unserviceable, deselect them as follows:**
  PRESS the DATA key.
  SELECT the POSITION MONITOR page.
  SELECT the SELECTED NAVAIDS page.
  Under “DESELECT”, INSERT the NAVAID identifier in the brackets.

The flight crew can only make four deselections.

Note: *When a NAVAID is deselected, it is no more used for navigation by the FMGC during the rest of the flight. However a deselected NAVAID can still be manually tuned on the RAD NAV page and displayed on ND.*

FLIGHT PLAN INITIALIZATION



Ident.: PRO-NOR-SRP-01-10-A-00003961.0025001 / 22 MAY 12

[2] **Applicable to: MSN 01767-01920, 02108, 02275-02334, 02388, 02457, 02584-02670, 02737-02804, 03750, 04491, 04532, 04645, 05120, 05218, 06720-09063**

GENERAL

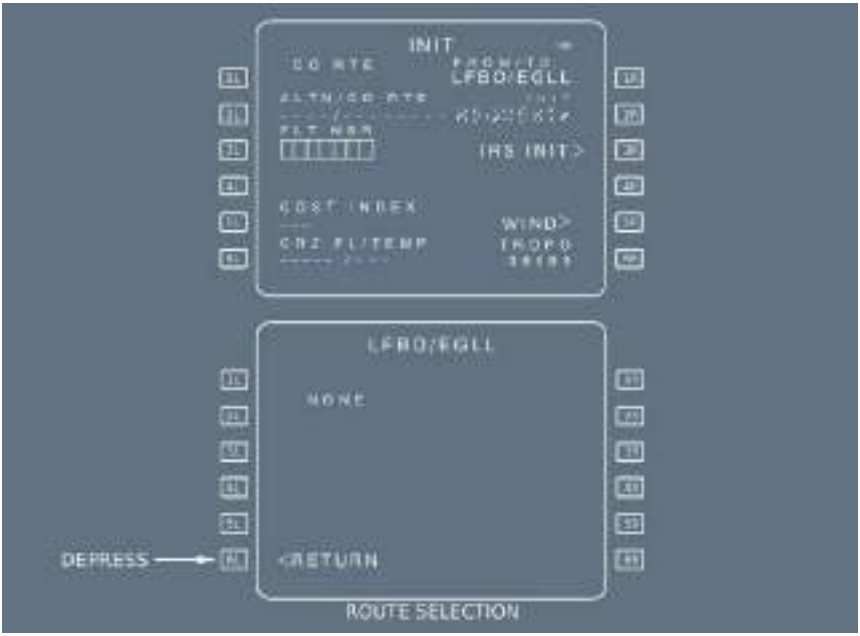
Follow SOP instructions, when the route is a company route stored in the database.

- **If the company route is unknown, proceed as follows:**

WRITE a “FROM/TO” city pair, then ENTER it:

If one or more company routes run between the cities, the ROUTE SELECTION page appears and defines them.

INSERT the preferred company route.



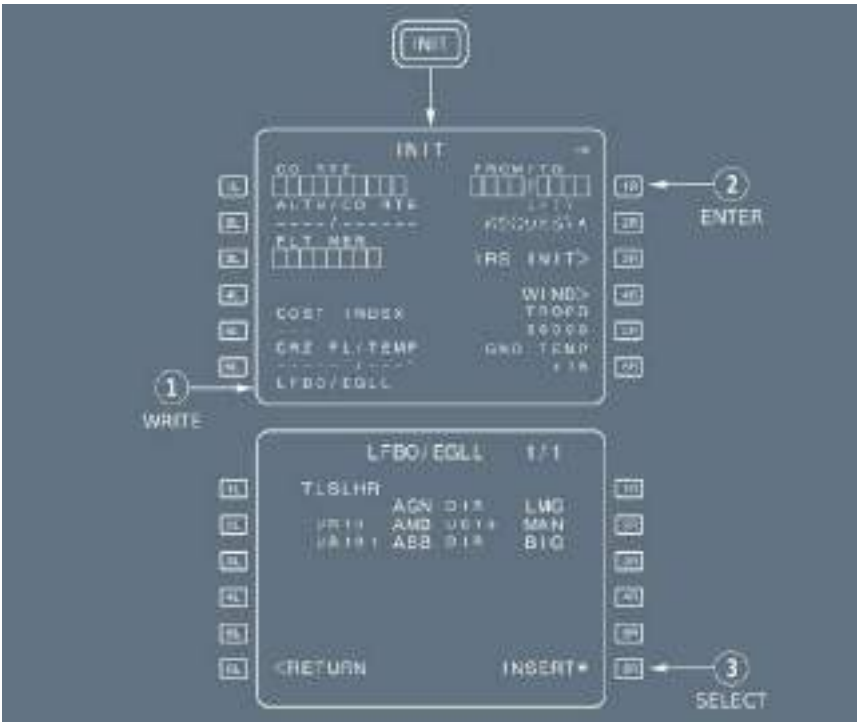
- **If the database does not contain a company route:**

The flight plan must be constructed manually:

PRESS the INIT key
ENTER a city pair in the FROM/TO field.

The ROUTE SELECTION page comes up with “NONE”

SELECT RETURN [6L] key then construct the flight plan manually.



If waypoints, NAVAIDs or airports are not in the NAV database, the crew must define and store them manually, using the “data stored” function.

Ident.: PRO-NOR-SRP-01-10-A-00003961.0062001 / 22 MAY 12
Applicable to: MSN 01957-02097, 02121-02204, 02359, 02405-02443, 02482, 02712, 02908-03618, 03782-04488, 04506-04518, 04535-04637, 04752-05094, 05155-05190, 05230-06336

GENERAL

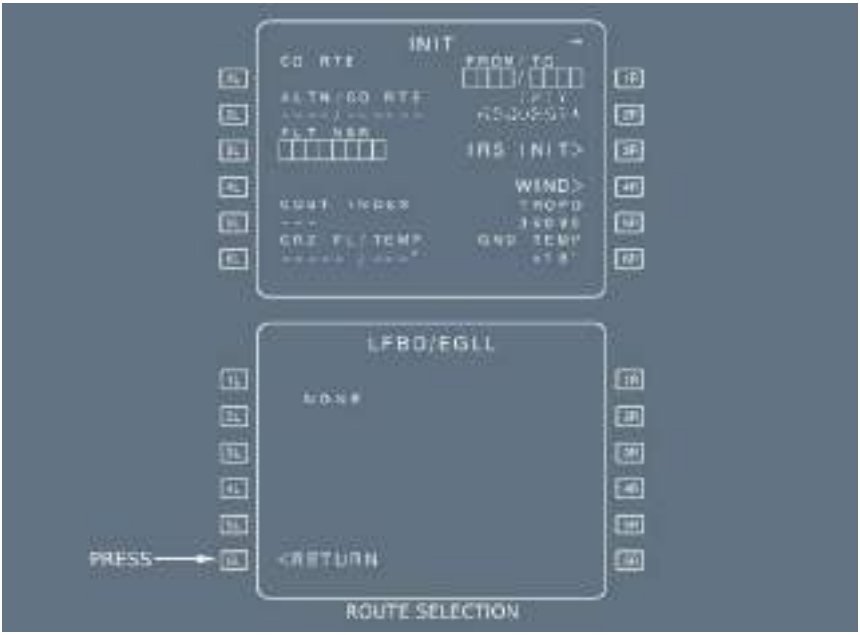
Follow SOP instructions, when the route is a company route stored in the database.

- **If the company route is unknown, proceed as follows:**

WRITE a “FROM/TO” city pair, then ENTER it:

If one or more company routes run between the cities, the ROUTE SELECTION page appears and defines them.

INSERT the preferred company route.
Check COST INDEX.
Check/modify GND TEMP.



- **If the database does not contain a company route:**

The flight plan must be constructed manually:

PRESS the INIT key
ENTER a city pair in the FROM/TO field.

The ROUTE SELECTION page comes up with “NONE”

SELECT RETURN [6L] key then construct the flight plan manually.

If waypoints, NAVAIDs or airports are not in the NAV database, the crew must define and store them manually, using the “data stored” function.

Ident.: PRO-NOR-SRP-01-10-A-00003962.0037001 / 23 JUN 15
Applicable to: MSN 01767-01920, 02108, 02204-02388, 02443-02457, 02584-02914, 03264-03618, 03782-03943

ALIGNING IRS

PRESS the INIT key, and then the IRS INIT prompt.

IRS INIT page is displayed with the airport reference point as default coordinates.

If necessary, PRESS [1L] and/or [1R] and use scroll keys to adjust the latitude and/or longitude values.

For example, this can be used to enter the gate precise coordinates when the aircraft is intended to fly without GPS on long segments without radio coverage.

PRESS the ALIGN ON REF prompt and CONFIRM ALIGN* prompt.

The displayed coordinates are sent to ADIRS for initialization.
The alignment status changes to ALIGNING ON REF.

- **If the "CHECK IRS/AIRPORT POS" or "REF/GPS POS DIF" or "REF/LAST IRS POS DIF" message is displayed:**
  CHECK the departure airport on INIT A page and CORRECT it if necessary.
  REALIGN the IRS per the procedure described previously.
- **If a new FROM or a new CO RTE is entered after IRS alignment is already completed, the ALIGN ON REF prompt is displayed in [6R]:**
  REALIGN the IRS per the procedure described previously.

Ident.: PRO-NOR-SRP-01-10-A-00003962.0046001 / 23 JUN 15

[3] **Applicable to: MSN 01957-02097, 02121-02195, 02405, 02482, 03071-03138, 03750, 04008-09063**

ALIGNING IRS

The alignment phase is completed, when the ADIRS is initialized to an appropriate position. If the GPS is available, initialization is automatic, using the GPS position. Flight crew intervention is not necessary.
However, automatic initialization may be manually overriden by flight crew entry, at any moment during the alignment phase. In this case, perform the following procedure as soon as possible, to prevent delays if an alignment error occurs:

PRESS the INIT key, and then the IRS INIT prompt.

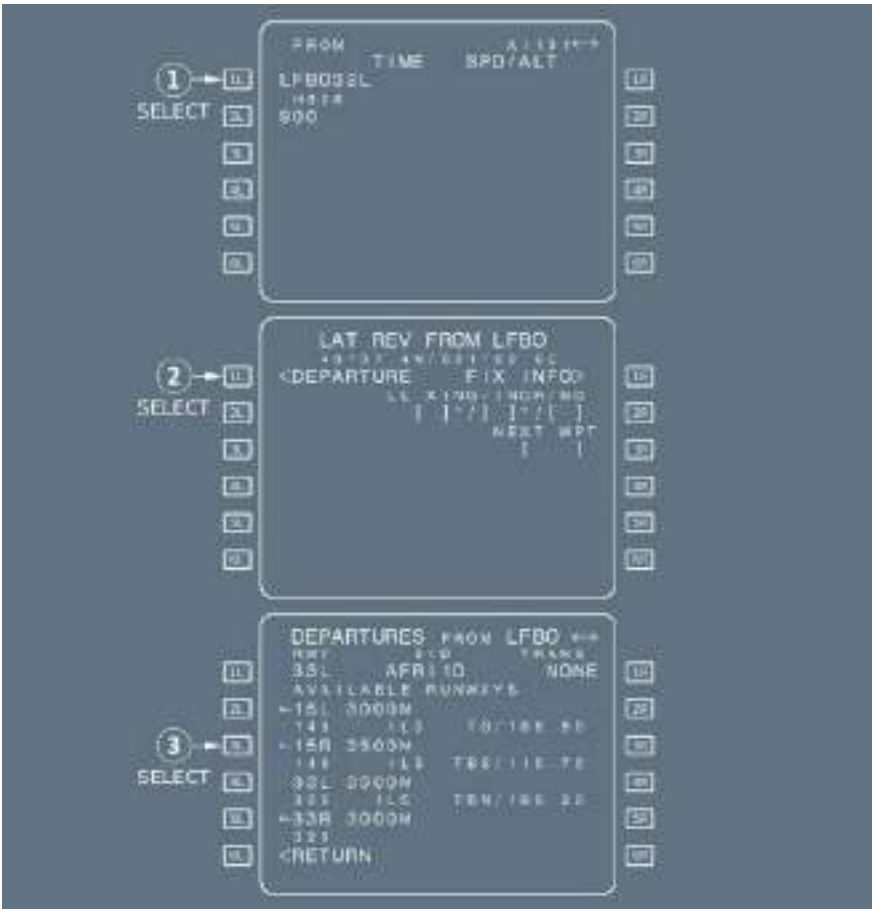
IRS INIT page is displayed with the airport reference point as default coordinates.

If necessary, PRESS [1L] and/or [1R] and use scroll keys to adjust the latitude and/or longitude values.

For example, this can be used to enter the gate precise coordinates when the aircraft is intended to fly without GPS on long segments without radio coverage.

PRESS the ALIGN ON REF prompt and CONFIRM ALIGN* prompt.

The displayed coordinates are sent to ADIRS for initialization.
The alignment status changes to ALIGNING ON REF.



- **If the "CHECK IRS/AIRPORT POS" or "REF/GPS POS DIF" or "REF/LAST IRS POS DIF" message is displayed:**
  CHECK the departure airport on INIT A page and CORRECT it if necessary.
  REALIGN the IRS per the procedure described previously.
- **If a new FROM or a new CO RTE is entered after IRS alignment is already completed, the ALIGN ON REF prompt is displayed in [6R]:**
  REALIGN the IRS per the procedure described previously.

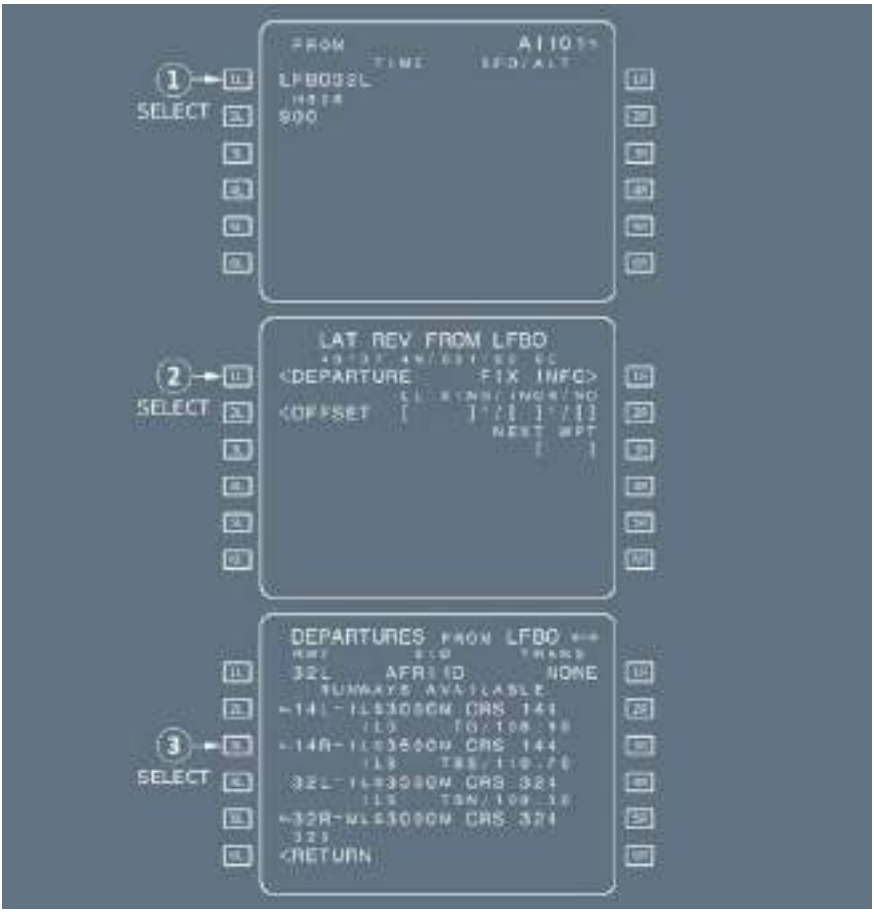
[4] **Applicable to: MSN 01767-01920, 02108, 02275-02334, 02388, 02457, 02584-02670, 02737-02804, 03750, 04491, 04532, 04645, 05120, 05218, 06720-09063**

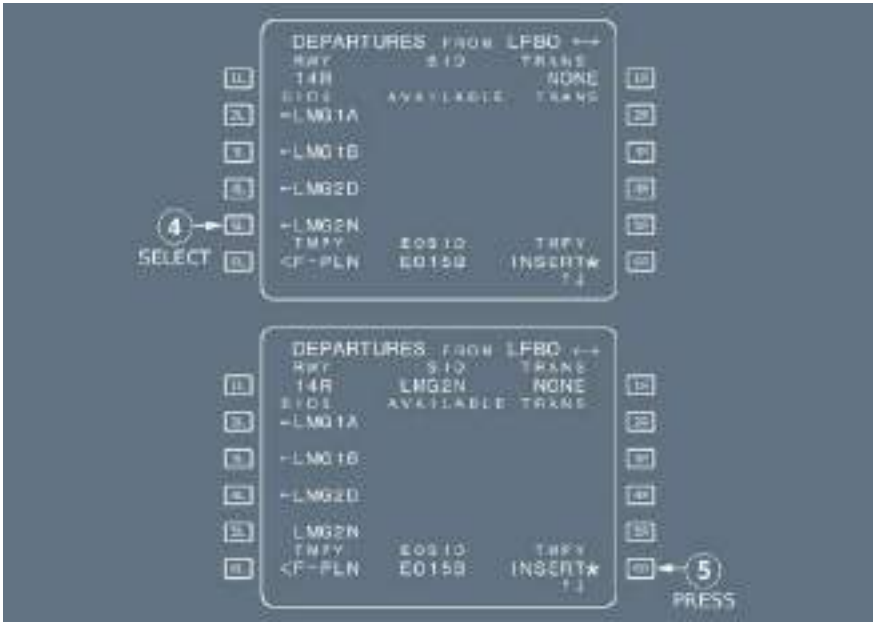
LATERAL FLIGHT PLAN

SELECTING A DEPARTURE

You may use the "NEXT PAGE" ⏩, or the "←" or "→" keys to gain access to the listings of runways, SIDs, and transitions.



Procedure



PRESS the F-PLN key on MCDU
SELECT the DEPARTURE prompt [1L] key
SELECT the RWY in USE, SID and TRANS
CHECK the resulting temporary F-PLN
If it is correct, INSERT it using [6R] key.
If it is not correct, ERASE it using [6L] key.

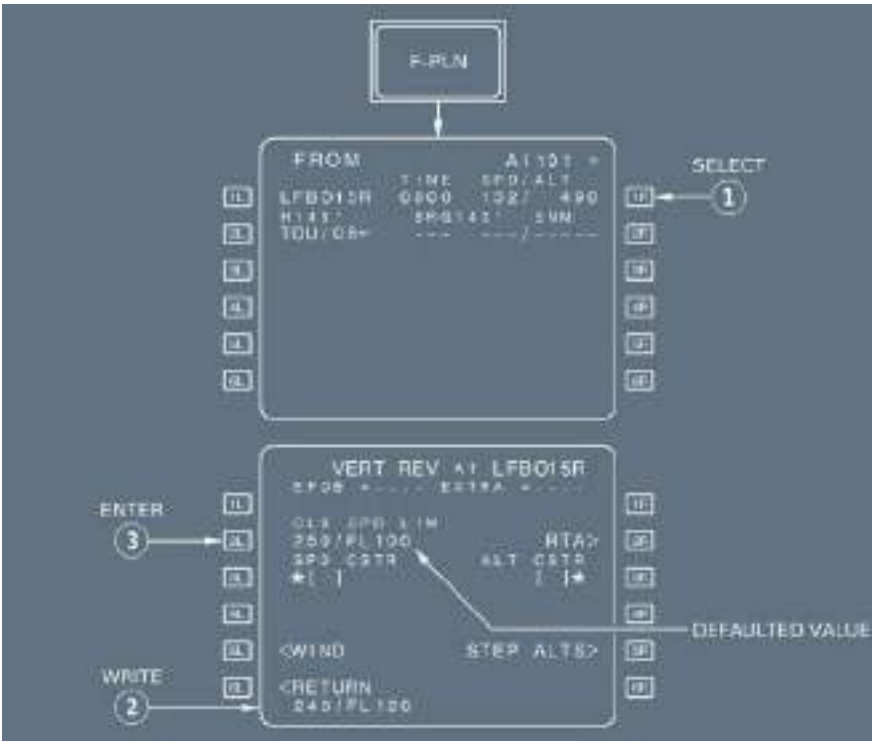
Ident.: PRO-NOR-SRP-01-10-A-00003963.0026001 / 22 MAY 12
Applicable to: MSN 01957-02097, 02121-02204, 02359, 02405-02443, 02482, 02712, 02908-03618, 03782-04488, 04506-04518, 04535-04637, 04752-05094, 05155-05190, 05230-06336

LATERAL FLIGHT PLAN

SELECTING A DEPARTURE

You may use the "←" or "→" keys to gain access to the listings of runways, or the one of SIDs, and transitions.

Procedure



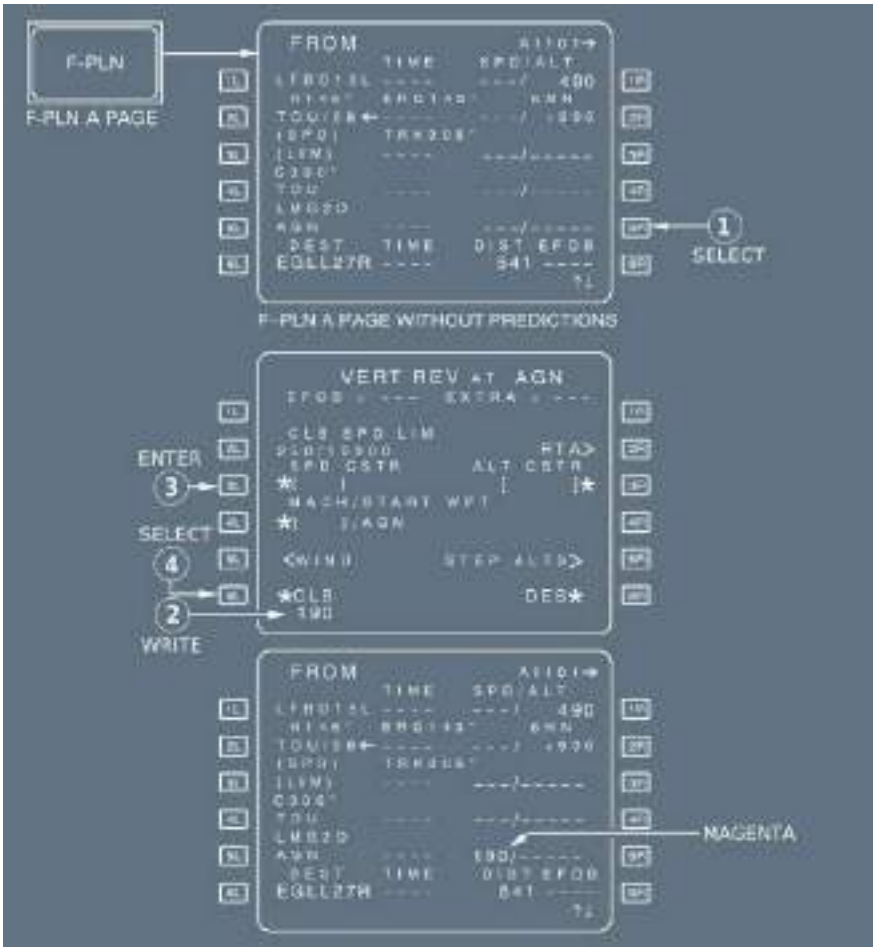
PRESS the F-PLN key on MCDU
SELECT the DEPARTURE prompt [1L] key
SELECT the RWY in USE, SID and TRANS
CHECK and INSERT the TMPY F-PLN or continue with next revision.

Ident.: PRO-NOR-SRP-01-10-A-00003964.0004001 / 22 MAY 12

5 **Applicable to: MSN 01767-01920, 02108, 02275-02334, 02388, 02457, 02584-02670, 02737-02804, 03750, 04491, 04532, 04645, 05120, 05218, 06720-09063**

VERTICAL FLIGHT PLAN

ENTERING/MODIFYING A SPEED LIMIT



PRESS the F-PLN key on the MCDU.
SELECT VERTICAL REVISION at the FROM waypoint.
WRITE a new speed limit/altitude and ENTER.

The crew can insert one climb speed limit and one descent speed limit into the vertical flight plan, or modify or clear the limits that are already in it.
The speed limit is defined by a speed and an altitude (for example, 230/9 000), which means that the managed speed target will be limited by the speed limit when the aircraft flies below the specified altitude.

In both climb and descent, 250 kt at 10 000 ft is the default speed limit in the vertical flight plan.
The vertical revision page presents the climb speed (CLB SPD) limit if the revised waypoint is between departure and top of descent.
The vertical revision page shows the descent speed (DES SPD) limit, if the revised waypoint is between top of descent and destination.
It can be deleted by a clear action, the field reverts to brackets. It can also be cleared directly on the F-PLN A page by clearing the SPD LIM pseudo-waypoint.

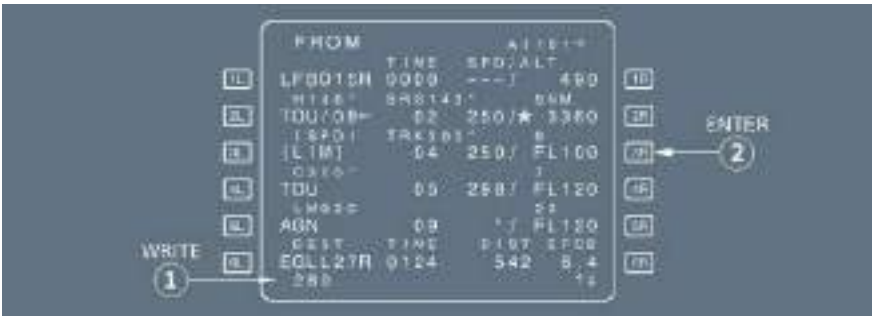
ENTERING A SPEED CONSTRAINT

Procedure

PRESS the F-PLN key on the MCDU.
SELECT the VERT REV page at the revised waypoint.
WRITE the speed constraint value into the scratchpad and ENTER it in 3L.
INSERT the constraint using the appropriate *CLB or DES* prompt when displayed. If CLB and DES are not displayed, insertion occurs when the value is entered in 3L.

The system displays the climb (CLB) or the descent (DES) prompt at [6L] or [6R] when the predictions are not yet available or when the waypoint is part of the cruise phase as originally defined.
When predictions are not yet available, the constraints are displayed on the F-PLN A page in magenta.

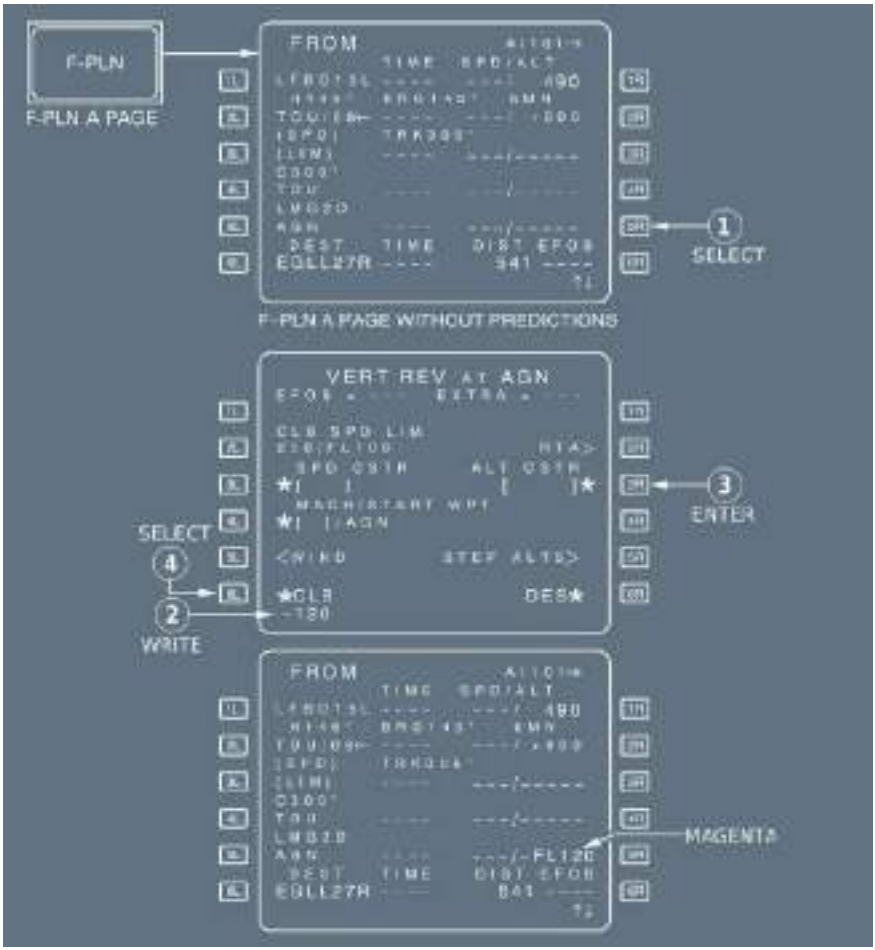
When predictions are available, the speed constraint is highlighted by a star (*).
** If the predicted speed matches the constraint, the star is magenta.*
** If the prediction is that the aircraft will miss the speed constraint, the star is amber.*
If a speed constraint cannot be met (by more than 10 kt), the FMGS generates the message "SPD ERROR AT WPT XX".



A speed constraint may be assigned to any waypoint in the climb or the descent phase except the FROM, origin, or destination waypoints, and any pseudo waypoint.

When a speed constraint is assigned to a waypoint, the constraint will limit the managed speed target as follows:
- *In takeoff or climb phase until you pass the constrained waypoint.*
- *In descent an approach phase, after passing the constrained waypoint.*

Speed constraints are observed by the FMGS when NAV mode and speed managed are active.



ENTERING A SPEED CONSTRAINT THROUGH F-PLN A PAGE

You may also enter a speed constraint through the F-PLN page.

Note: You may delete the constraint using the clear key on the relevant right hand key. However if there is an altitude constraint assigned at that point, the clear action deletes it too.

ENTERING AN ALTITUDE CONSTRAINT

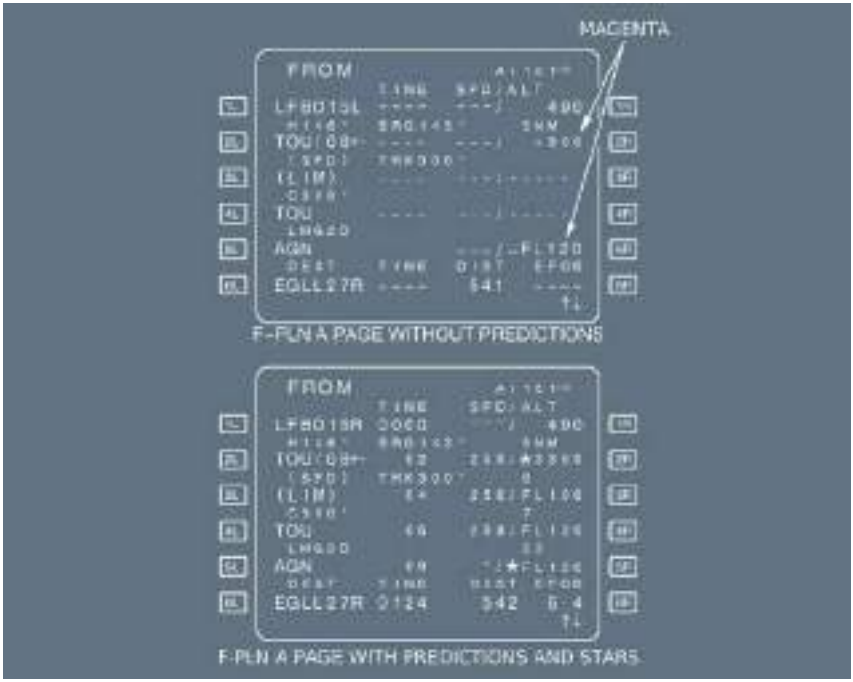
Procedure

PRESS the F-PLN key on the MCDU.

SELECT the "VERT REV" page at the revised waypoint.
WRITE an altitude constraint in the scratchpad and ENTER it in 3R.
INSERT the constraint using *CLB or DES* prompt when it is displayed. Otherwise the value is inserted when it is entered in 3R field.

*The system displays the *CLB or DES* prompt, when the predictions are not yet available, or when the waypoint is part of the cruise phase as originally defined.*

Note: *In case of QFE operations, the altitude constraints must be converted and entered as an altitude in feet.*



You or the database may assign an altitude constraint to any waypoint in the climb or descent phases except the FROM, origin, or destination waypoints, or any pseudo waypoint.
An altitude constraint may be defined as an "at", an "at or above", or an "at or below" constraint. In certain procedures, the database may define an altitude constraint as a window in which the aircraft should fly.

Enter "AT" constraints with no sign.
Enter "AT or ABOVE" constraints preceded by a + sign (+FL 130, for example).
Enter "AT or BELOW" constraints preceded by a – sign (-15 000, for example).
enter four or five-digit number when entering altitude. Include the lead zero (0 500 ft , for example).

For flight level, enter a two- or three-digit number, with or without the letters "FL". The lead zero is optional. (Examples : +FL 120 or +120 ; -FL 090 or -90 or -090)

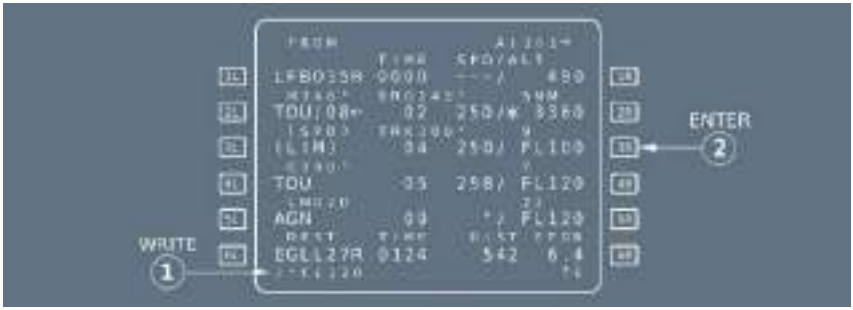
Enter the altitude value as either altitude or flight level ; the MCDU displays the selected value as an "ALT" or "FL," as appropriate for the transition altitude.

The constraint must be higher than the thrust reduction altitude and lower than the cruise flight level.
Once inserted in the flight plan, the altitude constraint (ALT CSTR) is displayed in magenta as long as predictions are not available.
When predictions are available, the altitude constraints are replaced by the predicted altitude at relevant waypoints highlighted by a star.
** If the predicted altitude matches the constraint the star is magenta. If the predicted altitude is missed (by more than 250 ft), the star is amber.*

The vertical revision page displays “ALT ERROR”, along with the difference between the constraint and the predicted altitude at the revised waypoint.

ND Display

An altitude-constrained waypoint is marked by a circle (□) on the navigation display.



This circle is white when the guidance does not take the altitude constraint into account. It is magenta if the guidance system takes the altitude constraint into account and predicts that it will be matched.
It is amber if the guidance system takes the altitude constraint into account and predicts that it will not be matched.

The aircraft should be at or below FL 120 at AGN and above FL 180 at LACOU.

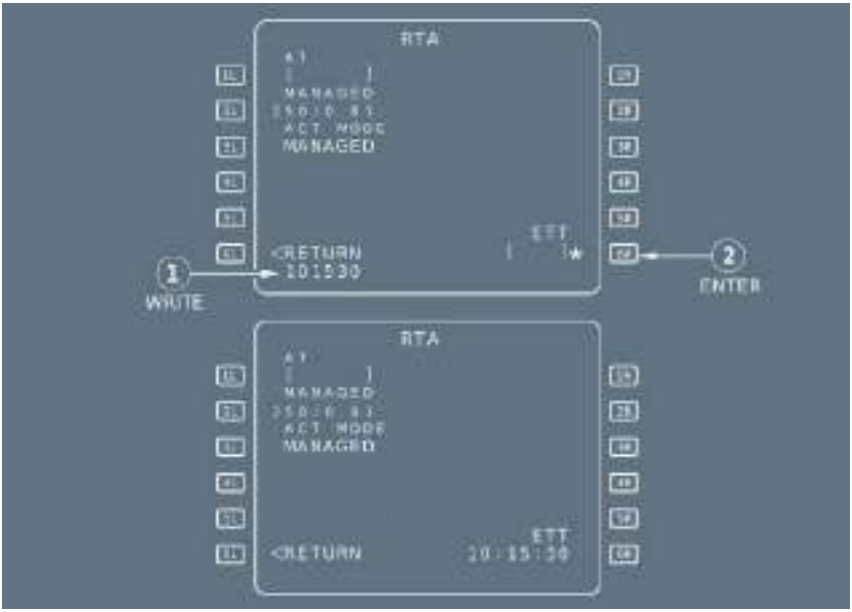
Entering an Altitude Constraint Through F-PLN A Page

The pilot may also enter an altitude constraint directly through the F-PLN A page.
When entering the value into the scratchpad do not forget the slash e.g. /-120 or /-FL 120.
If the slash is omitted the value will be considered as a speed constraint if it is within the range value.

Use CLR to delete them directly from the flight plan page, as well. However, if there is also a speed constraint assigned at that waypoint, the clear action deletes it too.

ENTERING AN ESTIMATED TIME OF TAKEOFF (ETT)

In Preflight Phase:



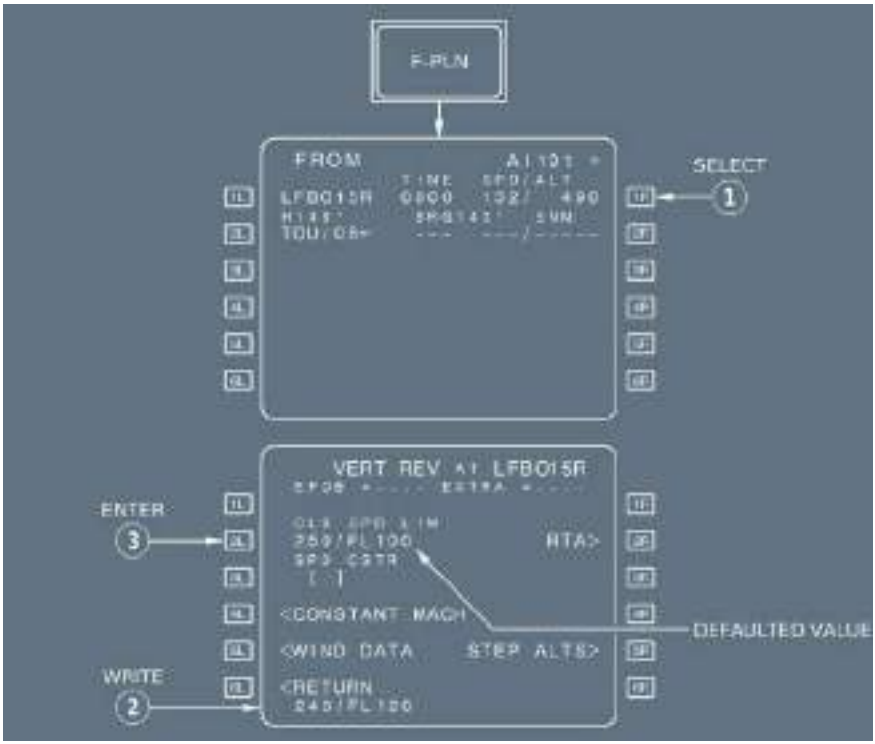
SELECT the SEC F-PLN key on the MCDU.
SELECT a VERT REV at any waypoint.
SELECT the Required Time of Arrival (RTA) prompt (2R).

The MCDU displays the RTA page.

ENTER the Estimated Takeoff Time in the [6R] field.

The format is HHMMSS (entry of seconds is not mandatory).

ENTER it in the 6R field



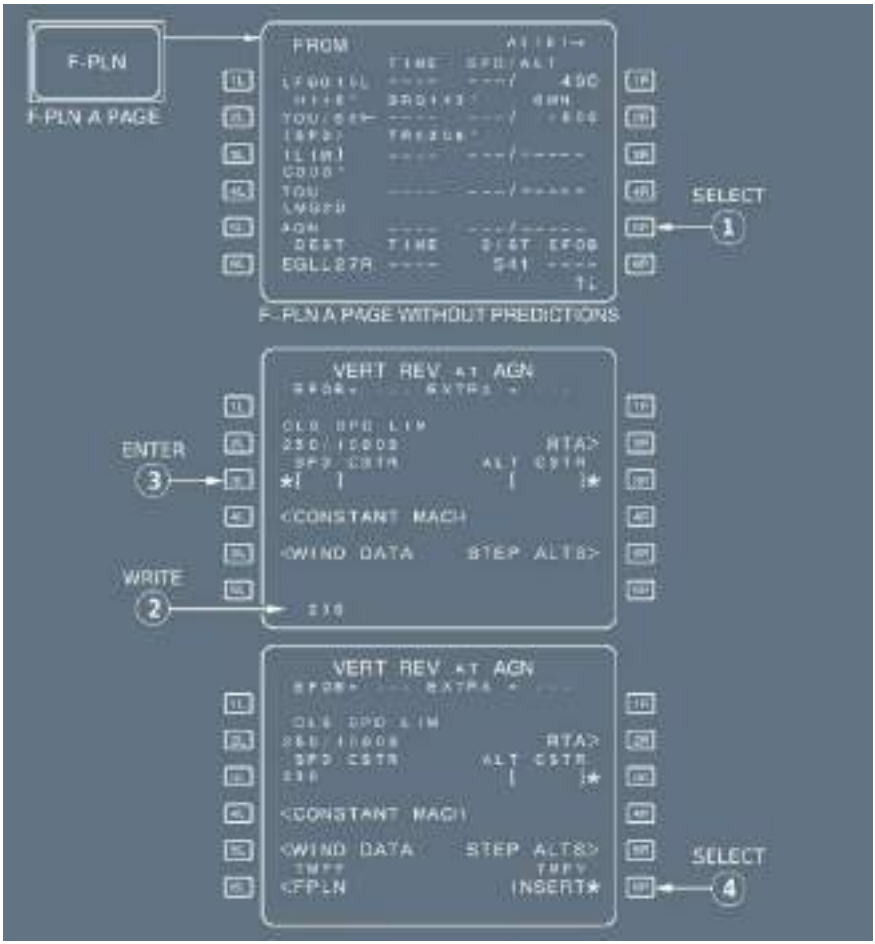
If the aircraft has not taken off by the time entered as estimated takeoff time, the MCDU displays the “CLK IS TAKE OFF TIME” message, meaning that the system will replace your estimated takeoff time with the actual time.
When beginning the takeoff roll, the system automatically adopts that clock time as the takeoff time.
If the origin airport is changed, or the clock time is invalid, the system automatically deletes the estimated takeoff time.

Ident.: PRO-NOR-SRP-01-10-A-00003964.0039001 / 22 MAY 12
Applicable to: MSN 01957-02097, 02121-02204, 02359, 02405-02443, 02482, 02712, 02908-03618, 03782-04488, 04506-04518, 04535-04637, 04752-05094, 05155-05190, 05230-06336

VERTICAL FLIGHT PLAN

ENTERING/MODIFYING A SPEED LIMIT

PRESS the F-PLN key on the MCDU.
SELECT VERTICAL REVISION at the FROM waypoint.
WRITE a new speed limit/altitude and ENTER.



The crew can insert one climb speed limit and one descent speed limit into the vertical flight plan, or modify or clear the limits that are already in it.
The speed limit is defined by a speed and an altitude (for example, 230/9 000), which means that the managed speed target will be limited by the speed limit when the aircraft flies below the specified altitude.

In both climb and descent, 250 kt at 10 000 ft is the default speed limit in the vertical flight plan.
The vertical revision page presents the climb speed (CLB SPD) limit if the revised waypoint is between departure and top of descent.
The vertical revision page shows the descent speed (DES SPD) limit, if the revised waypoint is between top of descent and destination.
It can be deleted by a clear action, the field reverts to brackets. It can also be cleared directly on the F-PLN A page by clearing the SPD LIM pseudo-waypoint.

CHECK and INSERT the TMPY F-PLN or continue with next revision.

Note: *The speed limit cannot be cleared in the temporary flight plan. If the crew inadvertly tries to clear the SPD LIM in the TMPY F-PLN, the message "NOT ALLOWED" is displayed in the scratchpad.*

ENTERING A SPEED CONSTRAINT

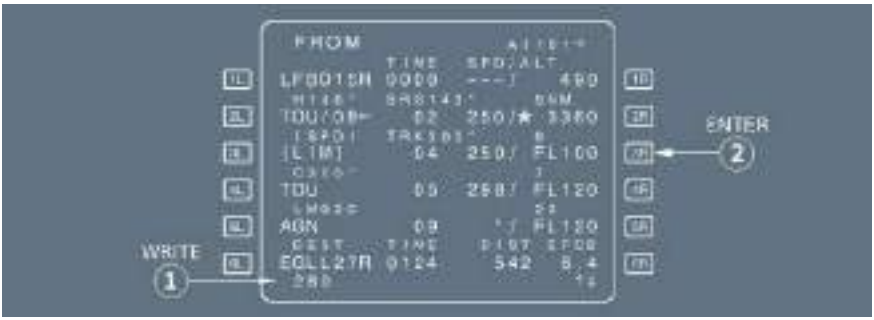
Procedure

PRESS the F-PLN key on the MCDU.
SELECT the VERT REV page at the revised waypoint.
WRITE the speed constraint value into the scratchpad and ENTER it in 3L.
CHECK and INSERT the TMPY F-PLN or continue with next revision.

Note: *A speed constraint can also be entered directly on F-PLN page, without using VERT REV page.*

When predictions are not yet available, the constraints are displayed on the F-PLN A page in magenta.

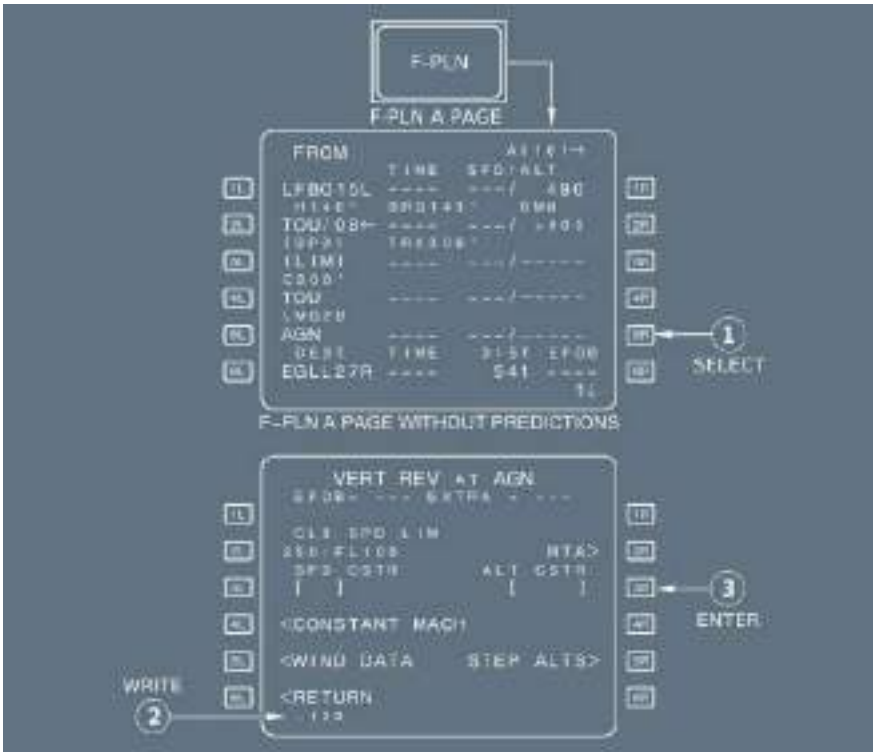
When predictions are available, the speed constraint is highlighted by a star (*).
** If the predicted speed matches the constraint, the star is magenta.*
** If the prediction is that the aircraft will miss the speed constraint, the star is amber.*
If a speed constraint cannot be met (by more than 10 kt), the FMGS generates the message "SPD ERROR AT WPT XX".



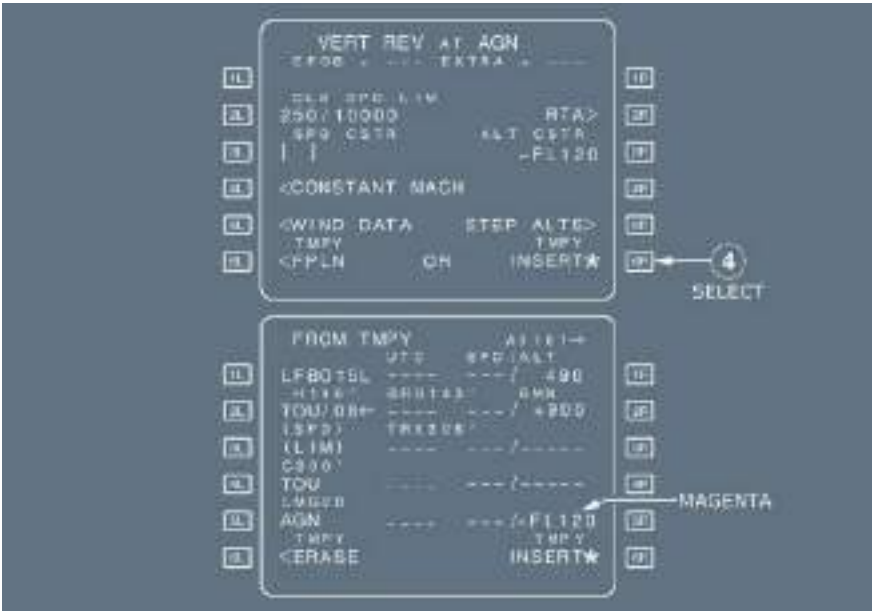
A speed constraint may be assigned to any waypoint in the climb or the descent phase except the FROM, origin, or destination waypoints, and any pseudo waypoint.

When a speed constraint is assigned to a waypoint, the constraint will limit the managed speed target as follows:
- *In takeoff or climb phase until you pass the constrained waypoint.*
- *In descent an approach phase, after passing the constrained waypoint.*

Speed constraints are observed by the FMGS when NAV mode and speed managed are active.



ENTERING A SPEED CONSTRAINT THROUGH F-PLN A PAGE



You may also enter a speed constraint through the F-PLN A page.

Note: *You may delete the constraint using the clear key on the relevant right hand key. However if there is an altitude constraint assigned at that point, the clear action deletes it too.*

ENTERING AN ALTITUDE CONSTRAINT

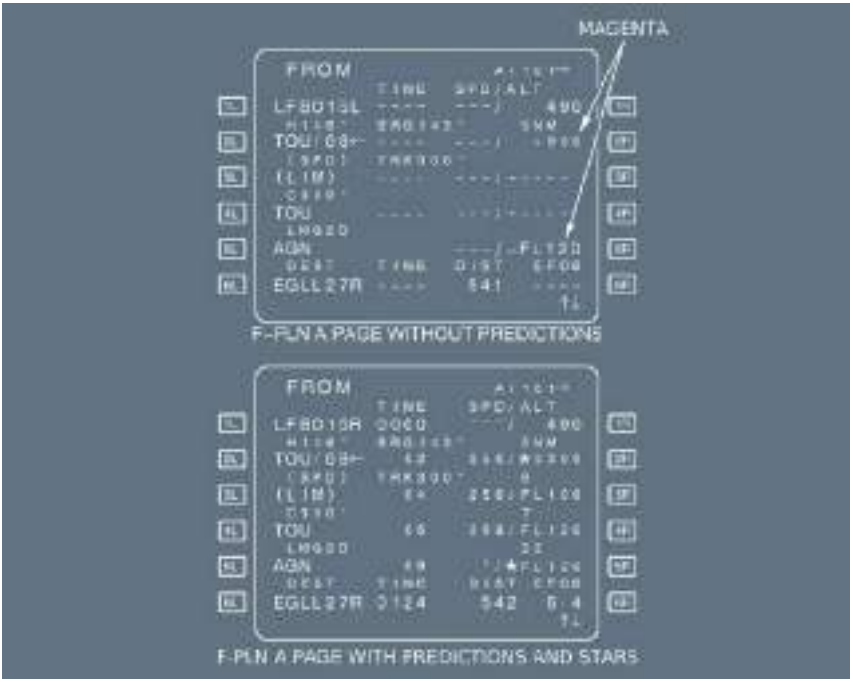
Procedure

PRESS the F-PLN key on the MCDU.
SELECT the "VERT REV" page at the revised waypoint.
WRITE an altitude constraint in the scratchpad and ENTER it in 3R.
If ← CLB and DES → prompt are displayed, SELECT the type of constraint.

The system displays the ← CLB or DES → prompt, when the predictions are not yet available, or when the waypoint is part of the cruise phase as originally defined.

CHECK and INSERT the TMPY F-PLN or continue with next revision

Note: *1. In case of QFE operations, the altitude constraints defined in heights (QFE) must be converted and entered in the FMS as altitudes (QNH).*
2. An altitude constraint can also be entered directly on F-PLN page, without using VERT REV page.



You or the database may assign an altitude constraint to any waypoint in the climb or descent phases except the FROM, origin, or destination waypoints, or any pseudo waypoint.
An altitude constraint may be defined as an "at", an "at or above", or an "at or below" constraint. In certain procedures, the database may define an altitude constraint as a window in which the aircraft should fly.

Enter “AT” constraints with no sign.
Enter “AT or ABOVE” constraints preceded by a + sign (+FL 130, for example).
Enter “AT or BELOW” constraints preceded by a – sign (-15 000, for example).
enter four or five-digit number when entering altitude. Include the lead zero (0 500 ft , for example).

For flight level, enter a two- or three-digit number, with or without the letters “FL”. The lead zero is optional. (Examples : +FL 120 or +120 ; -FL 090 or -90 or -090)

Enter the altitude value as either altitude or flight level ; the MCDU displays the selected value as an “ALT” or “FL,” as appropriate for the transition altitude.

The constraint must be higher than the thrust reduction altitude and lower than the cruise flight level.
Once inserted in the flight plan, the altitude constraint (ALT CSTR) is displayed in magenta as long as predictions are not available.
When predictions are available, the altitude constraints are replaced by the predicted altitude at relevant waypoints highlighted by a star.
** If the predicted altitude matches the constraint the star is magenta. If the predicted altitude is missed (by more than 250 ft), the star is amber.*

The vertical revision page displays “ALT ERROR”, along with the difference between the constraint and the predicted altitude at the revised waypoint.

ND Display

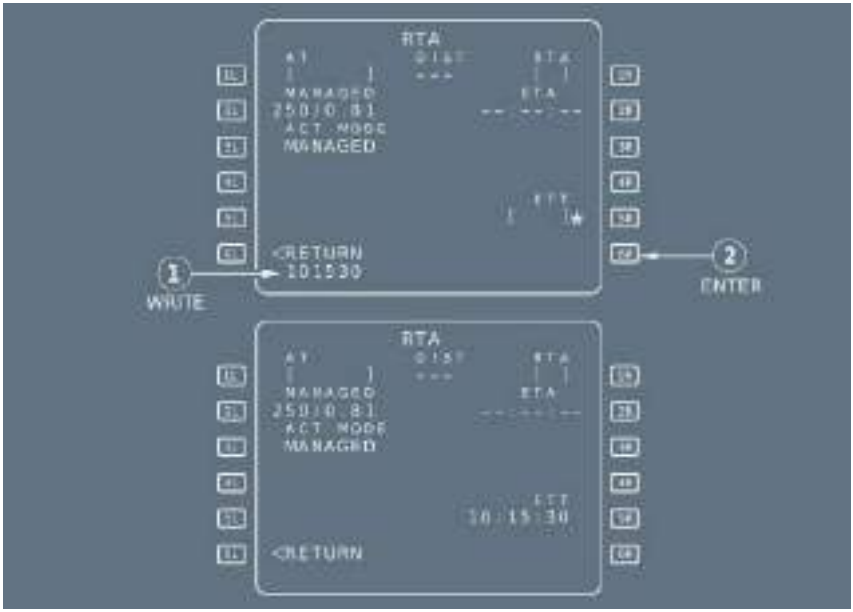
An altitude-constrained waypoint is marked by a circle (◯) on the navigation display.

This circle is white when the guidance does not take the altitude constraint into account. It is magenta if the guidance system takes the altitude constraint into account and predicts that it will be matched.
It is amber if the guidance system takes the altitude constraint into account and predicts that it will not be matched.

The aircraft should be at or below FL 120 at AGN and above FL 180 at LACOU.

Entering an Altitude Constraint Through F-PLN A Page

The pilot may also enter an altitude constraint directly through the F-PLN A page.
When entering the value into the scratchpad do not forget the slash e.g. /-120 or /-FL 120.
If the slash is omitted the value will be considered as a speed constraint if it is within the range value.



Use CLR to delete them directly from the flight plan page, as well. However, if there is also a speed constraint assigned at that waypoint, the clear action deletes it too.

ENTERING AN ESTIMATED TAKEOFF TIME (ETT)

In Preflight Phase:

SELECT the SEC F-PLN key on the MCDU.
SELECT a VERT REV at any waypoint.
SELECT the Required Time of Arrival (RTA) prompt (2R).
The MCDU displays the RTA page.
ENTER the Estimated Takeoff Time in the [5R] field.
The format is HHMMSS (entry of seconds is not mandatory).

If the aircraft has not taken off by the time entered as estimated takeoff time, the MCDU displays the “CLK IS TAKE OFF TIME” message, meaning that the system will replace your estimated takeoff time with the actual time.
When beginning the takeoff roll, the system automatically adopts that clock time as the takeoff time.
If the origin airport is changed, or the clock time is invalid, the system automatically deletes the estimated takeoff time.

Applicable to: ALL

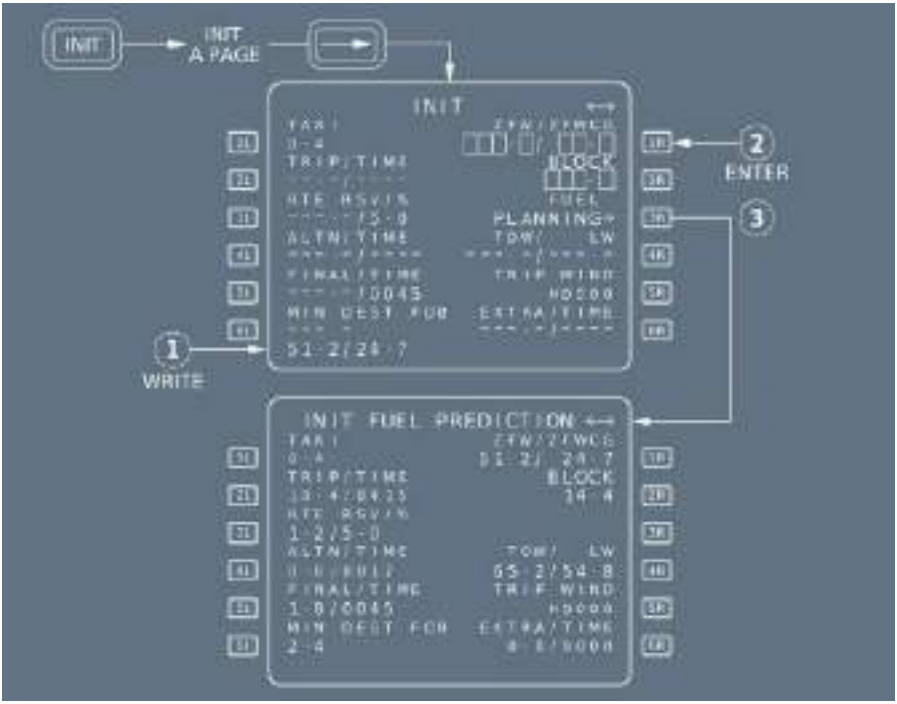
RADIO NAV

Whenever a NAVAID IDENT is correctly decoded, in agreement with that published, no audio check is necessary.
Morse decoding is displayed on the ND for VOR/DME, VOR/TAC, DME, ADF, and on the PFD for ILS.
Preferably use the identifier for NAVAID entry.
If the ADF IDENT is not in the database, be sure to include a decimal point when tuning the frequency (e.g 315. or 325.7).



Note: *Whenever, the runway ILS is intented to be retained for guidance after the takeoff phase, it is recommended to manually tune the ILS by its identifier.*

FMGS DATA INSERTION

Ident.: PRO-NOR-SRP-01-10-B-00003968.0024001 / 05 OCT 16
Applicable to: ALL

WEIGHT/CG INSERTION AND FUEL PLANNING

The flight crew must enter the Zero Fuel Weight (ZFW) and Zero Fuel Weight Center of Gravity (ZFWCG) values on the INIT B page, to allow the FMS to perform the fuel planning computations.

PROCEDURE

PRESS the INIT key, and the Next ("→") key to access the INIT B page.
ENTER the ZFW and ZFWCG value in the [1R] field.
The "FUEL PLANNING →" prompt appears in the [3R] field.

Note: As long as the final Load and Trim Sheet is not available, the crew should insert the estimated ZFW/ZFWCG in order to get fuel estimates. The ZFW and ZFWCG values must be updated with the final Load and Trim Sheet values.

CHECK/MODIFY the TAXI [1L], RTE RSV [3L] and FINAL TIME [5L] values.
The TAXI, RTE RSV and FINAL TIME fields display the default values specified in the AMI file (for example, "0.4 t" for TAXI, "5.0 %" for RTE RSV and "0045" for FINAL TIME). The flight crew may modify these values.

Note: *At takeoff, the RTE RSV field will automatically be reset to 0. The RTE RSV fuel is then added to the EXTRA fuel, which ensures that the EXTRA fuel and MIN DEST FOB values are consistent in flight.*

ENTER an ALTN fuel value in the [4L] field, as necessary.

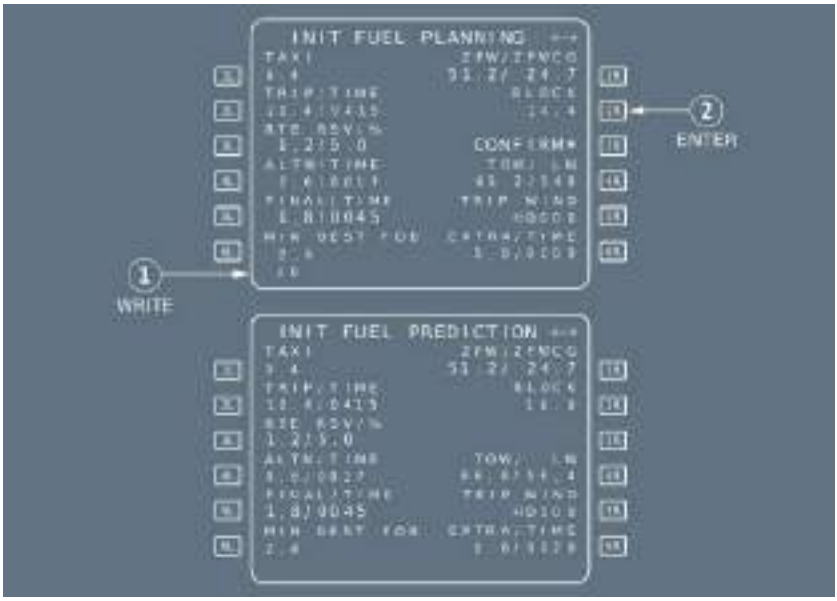
The flight crew may enter the ALTN fuel value planned on the Computerized Flight Plan (CFP), as necessary.

ENTER a MIN DEST FOB value in the [6L] field, as necessary.

Note: *MIN DEST FOB (equal to ALTN + FINAL) can be increased at flight crew discretion (e.g. when HOLD is expected at destination).*

ENTER the TRIP WIND value in the [5R] field, as necessary.

In no wind profile has been entered in the F-PLN, the crew may enter an average TRIP WIND in this field, to obtain more realistic fuel/time predictions before departure.



Note:
1. *The flight crew should only enter a TRIP WIND to obtain realistic fuel/time predictions, on ground. Then, the flight crew should enter a wind profile using the WIND pages, for fuel/time predictions in flight. As soon as flight crew has entered a wind profile on the WIND pages, the TRIP WIND will be erased.*
2. *If the crew has already defined a wind profile, even partially (such as climb wind), it is not possible to enter a TRIP WIND.*

ENTER the planned BLOCK fuel, as indicated in the computerized flight plan (CFP)

If the planned BLOCK fuel is not available, the crew may obtain a prediction of the minimum BLOCK fuel required for the flight by pressing the FUEL PLANNING prompt [3R].
Pressing this prompt makes the FMS compute the minimum required BLOCK fuel, which is the BLOCK fuel required to have EXTRA fuel = 0, based on the parameters entered on the INIT and F-PLN pages.
The computed BLOCK fuel value is displayed in the [2R] field, and a BLOCK CONFIRM prompt appears in the [3R] field.

Note: *In order to obtain a realistic fuel computation, the flight crew should ensure that the F-PLN initialization has been completed (including insertion of the ALTN F-PLN and/or ALTN fuel and/or MIN DEST FOB if necessary), and that flight parameters, such as CRZ FL, steps climbs (if any), and winds, have been inserted.*

- **When the final Load and Trim Sheet (LTS) data are available:**

ENTER the final ZFW/ZFWCG [1R], and the required BLOCK fuel [2R].

The FMS computes the predictions, based on the entered BLOCK fuel, and estimates the EXTRA fuel value.

CHECK the resulting computed data, against the data planned on the CFP: TRIP fuel, RTE RSV fuel, ALTN fuel, FINAL and EXTRA fuel values.

If necessary, the flight crew may modify the ALTN or FINAL fuel values.

PRINT the PREFLIGHT REPORT, if necessary.

When the final Load and Trim Sheet values (ZFW/ZFWCG/BLOCK) have been entered, the crew may print the pre-flight report, which provides a copy of the F-PLN with the associated FMS predictions.

Ident.: PRO-NOR-SRP-01-10-B-00003969.0010001 / 15 FEB 11
Applicable to: ALL

TAKEOFF WITH NO WEIGHT/CG DATA

If the crew does not enter ZFW/ZFWCG data prior takeoff, or if the FMGC looses these values due to a power interruption, the following will occur:

- At takeoff, the Speed Reference System (SRS) mode is available (provided a V2 has been inserted)
- When the aircraft leaves the SRS mode, the target speed becomes the current speed and reverts to selected.

Note: If the AP/FD has reverted to ALT or V/S (FPA) mode, the associated A/THR mode is SPEED. In this case, the system will probably reduce thrust, because the speed will be equal to, or greater than, the target speed.

- **When appropriate, to regain FMS predictions and associated managed modes:**
  INSERT the ZFW/ZFWCG values on the FUEL PRED page.

Ident.: PRO-NOR-SRP-01-10-B-00003970.0007001 / 15 FEB 11
Applicable to: ALL

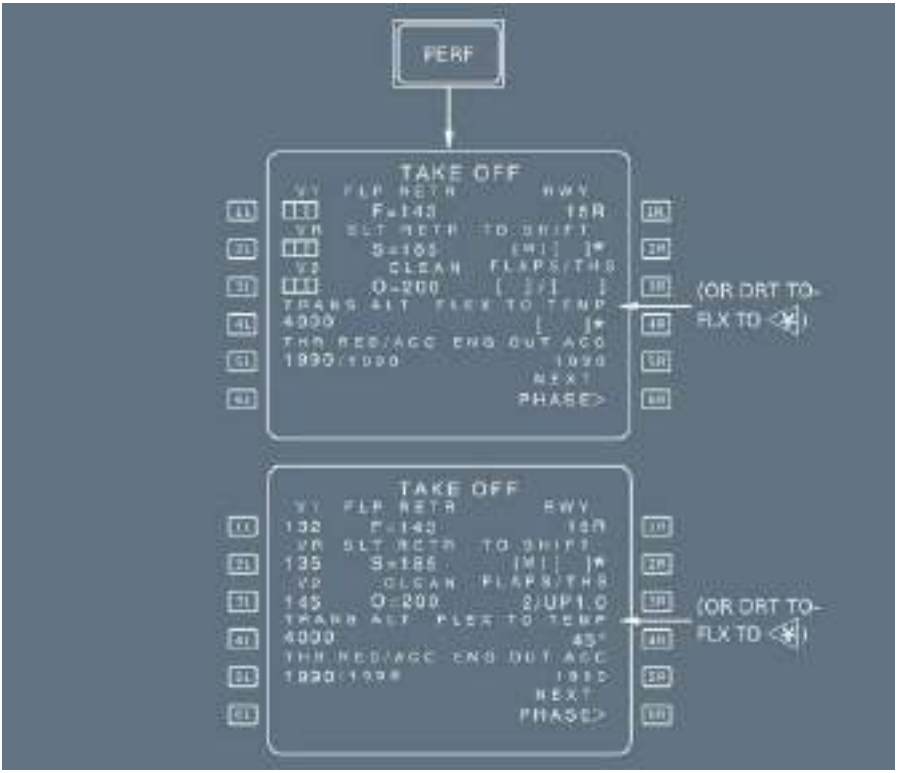
INSERTING WEIGHT/CG DATA AFTER ENGINE START

The flight crew must enter the ZFW/ZFWCG values on INIT B page prior to engine start. If these data have not been entered at engine start, the MCDU displays the “INITIALIZE WEIGHTS” amber message in the scratchpad. After engine start, the crew should enter the ZFW/ZFWCG values on the FUEL PRED page.

PRESS to the FUEL PRED key.
INSERT the ZFW/ZFWCG values in the [4R] field.

This allows predictions and performance computation.

CHECK the resulting computed data, against the data planned on the CFP: TRIP fuel, RTE RSV fuel, ALTN fuel, FINAL and EXTRA fuel values.



If necessary, the flight crew may modify the ALTN or FINAL fuel values.

PRINT the PREFLIGHT REPORT, if necessary.

When the final load sheet values (ZFW/ZFWCG/BLOCK) have been entered, the crew may print the pre-flight report, which provides a copy of the F-PLN with the associated FMS predictions.

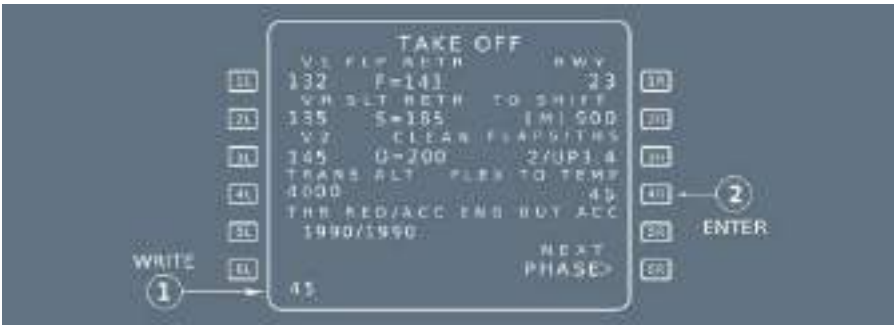
TAKEOFF DATA INSERTION

PROCEDURE

PRESS the PERF key on the MCDU.
WRITE successively and ENTER : V1, VR, V2.
WRITE and ENTER FLX TEMP or DRT TO .
CHECK/MODIFY the THR RED ALT (Thrust reduction altitude) See *.
CHECK/MODIFY the ACC ALT (acceleration altitude) See *.
CHECK/MODIFY the ENG OUT ACC (engine out acceleration altitude) See *.
CHECK/MODIFY the TRANS ALT (transition altitude) See *
WRITE and ENTER T.O. SHIFT.



CHECK V1, V2 on PFD See **

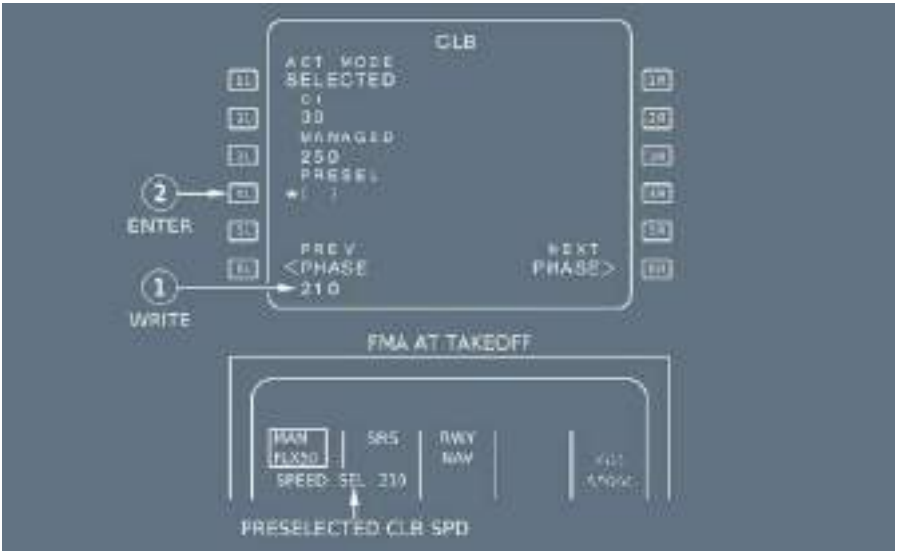
* *Altitudes less than 400 ft above airfield elevation cannot be selected.*

** *If the PFD does not display V2 at the top of its speed scale, check that at least one FD is ON.*

ENTERING A FLEX TEMPERATURE

WRITE the desired flex temperature in the scratchpad and ENTER using the [4R] key.

Ident.: PRO-NOR-SRP-01-10-B-00003972.0003001 / 22 MAY 12



6 **Applicable to: MSN 01767-01920, 02108, 02275-02334, 02388, 02457, 02584-02670, 02737-02804, 03750, 04491, 04532, 04645, 05120, 05218, 06720-09063**

CLIMB SPEED PRESELECTION

If the managed speeds for the initial climb are not suitable, the pilot can preselect an appropriate climb speed on the “PERF CLB” page, as long as the climb phase is not active.

The CLB SPD preselection applies, when the:

- ATC specifies an initial climb speed.
- Initial climb speed must be lower than normal because:
  - There are to be turns greater than 120 ° in the initial climb out.
  - Obstacle clearance, or some other situation, requires a high climb angle.
  - The airfield has a risk area to be quickly cleared (birds reported, for example).

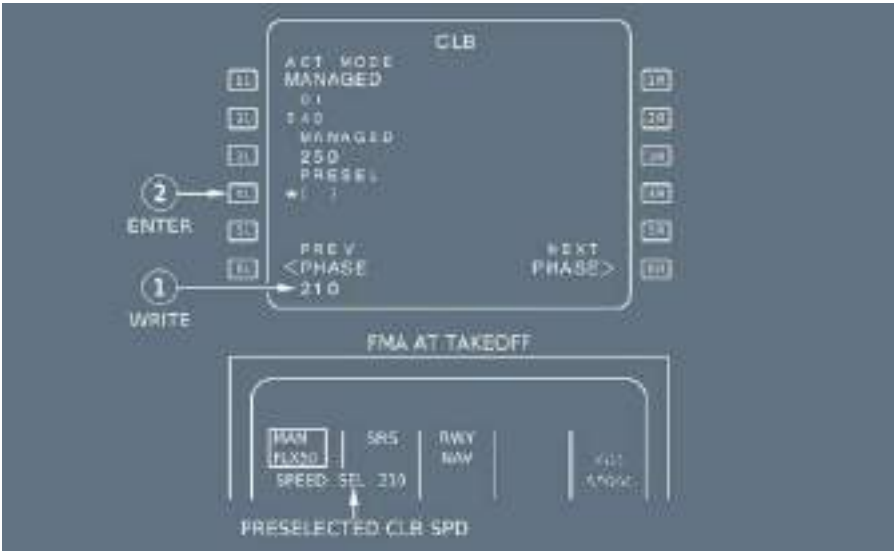
PROCEDURE

PRESS the PERF key on the MCDU.

The PERF TAKE OFF page is displayed.

SELECT the "NEXT PHASE" [6R] key to display the CLB page.
WRITE a climb speed and ENTER it.
To revert to managed speed, select MANAGED by pressing [3L].

When the aircraft is transitioning into the climb phase, the preselected value becomes the target speed:



- The selected speed target is active.
- The primary flight display shows the target speed in blue.
- The FCU's speed window displays the new speed or Mach number.

Applicable to: ALL

ENTERING A HEADING/TRACK PRESET FUNCTION

Tfhe heading/track preset allows the pilot to preset a takeoff or go-around heading or track before commanding the aircraft to take up that heading or track (manual activation).
The flight crew can enter a heading or a track preset while the aircraft is on the ground and until takeoff.

PROCEDURE

- **Before takeoff:**
  SET the appropriate HDG or TRK in the FCU window.
  This disarms the navigation mode and allows the runway mode to remain engaged after takeoff.
- **After takeoff:**
  PULL HDG/TRK knob.
  The heading or track mode engages on the preset value.

The direction in which the pilot rotates the HDG/TRK selection knob usually determines the direction of the turn. A left rotation (decreasing heading) produces a left turn; a right rotation produces a right turn.

However, when a heading has been preset before takeoff or go-around, the direction of the turn will be such as to cause the shortest turn at the moment of engagement.

CANCELLING THE HEADING/TRACK PRESET FUNCTION

The pilot can cancel the heading preset by pushing the HDG/TRK knob back in again. This engages or arms the NAV mode.

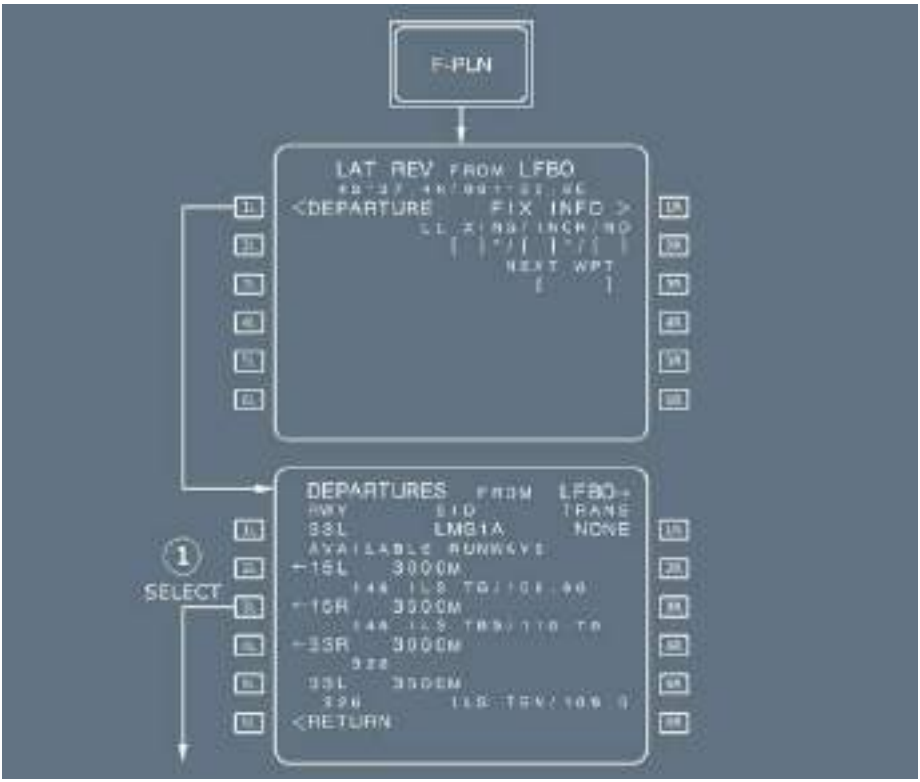
FMGS RE-INITIALIZATION AFTER A CANCELED FLIGHT

Ident.: PRO-NOR-SRP-01-10-00013064.0001001 / 16 NOV 11
Applicable to: ALL

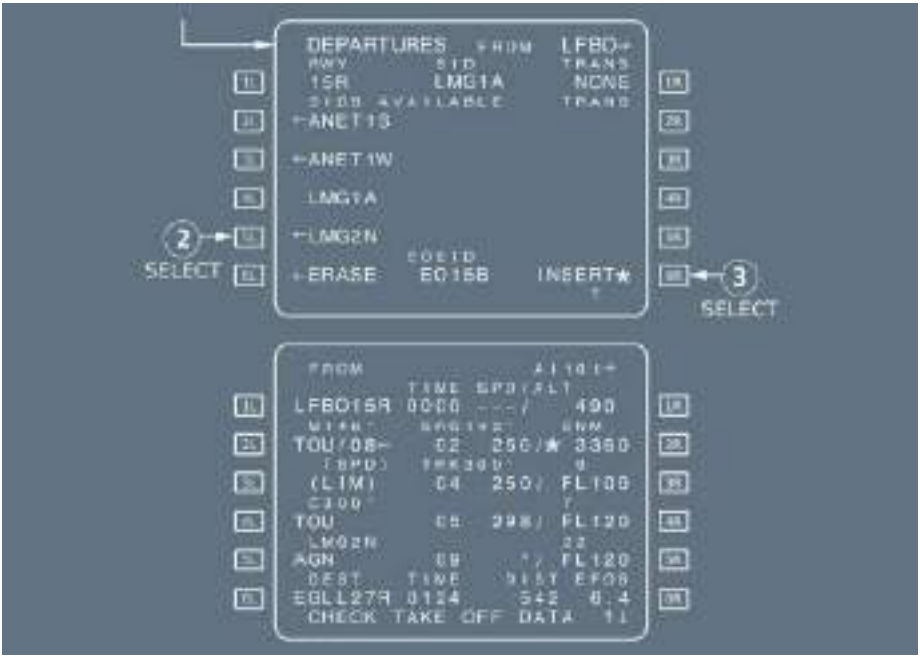
If the flight crew initially prepared a flight with all the data associated with this flight (takeoff speeds, winds, etc.), and if this flight is later canceled and replaced by another flight, the flight crew may use the following procedure to initialize the FMGS again:

PREPARE the new flight data in the secondary flight plan, using SEC INIT A, SEC INIT B, and SEC PERF pages
ACTIVATE the secondary flight plan.

Note: *When the flight crew activates the secondary flight plan, the following data of the primary flight plan is lost if the secondary flight plan does not include any replacement data:*



- *Alternate data*
- *Winds and cruise TEMP at waypoints as inserted on CRZ WIND pages*
- *Departure and arrival selection (STAR, APP, RWY) and approach parameters (QNH, TEMP, WIND, TRANS ALT, VAPP, MDA/MDH, DH, LDG CONF)*
- *Altitude, speed, and time constraints*
- *Steps*
- *CMS*
- *Offsets*
- *Flaps/THS*
- *Preselected cruise and descent speeds.*



Before Pushback or Start

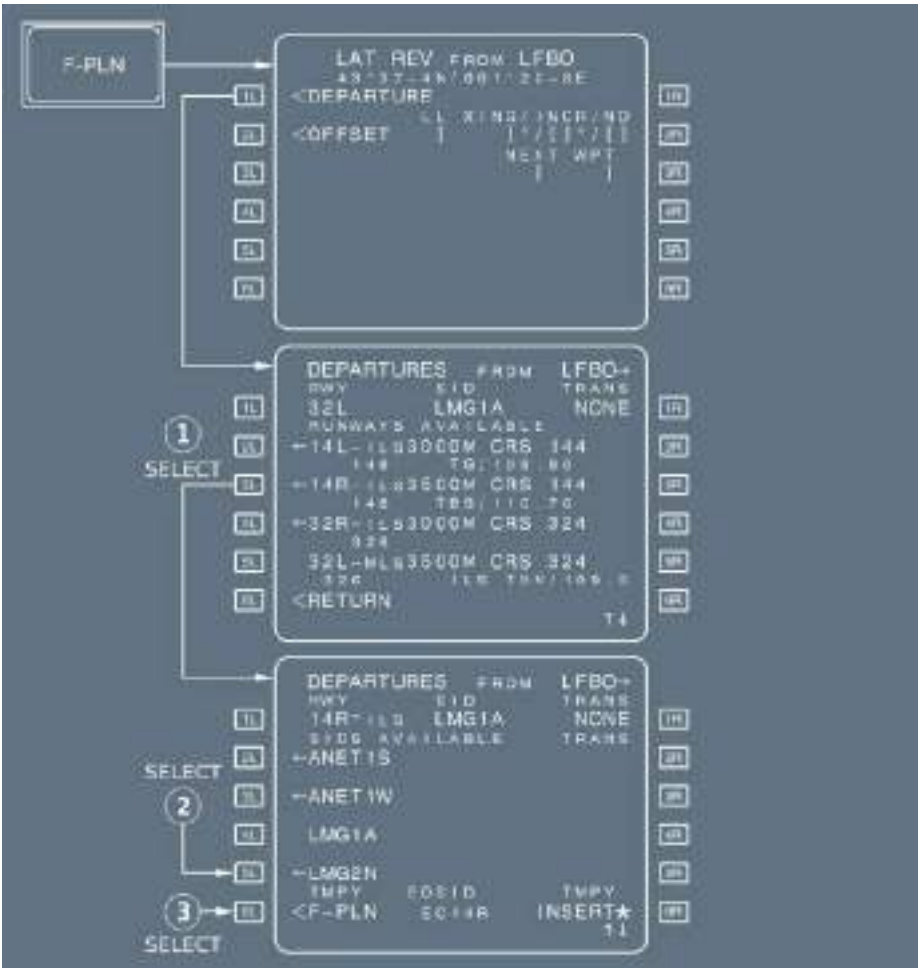
CHANGE OF RUNWAY

Ident.: PRO-NOR-SRP-01-15-00003975.0003001 / 22 MAY 12

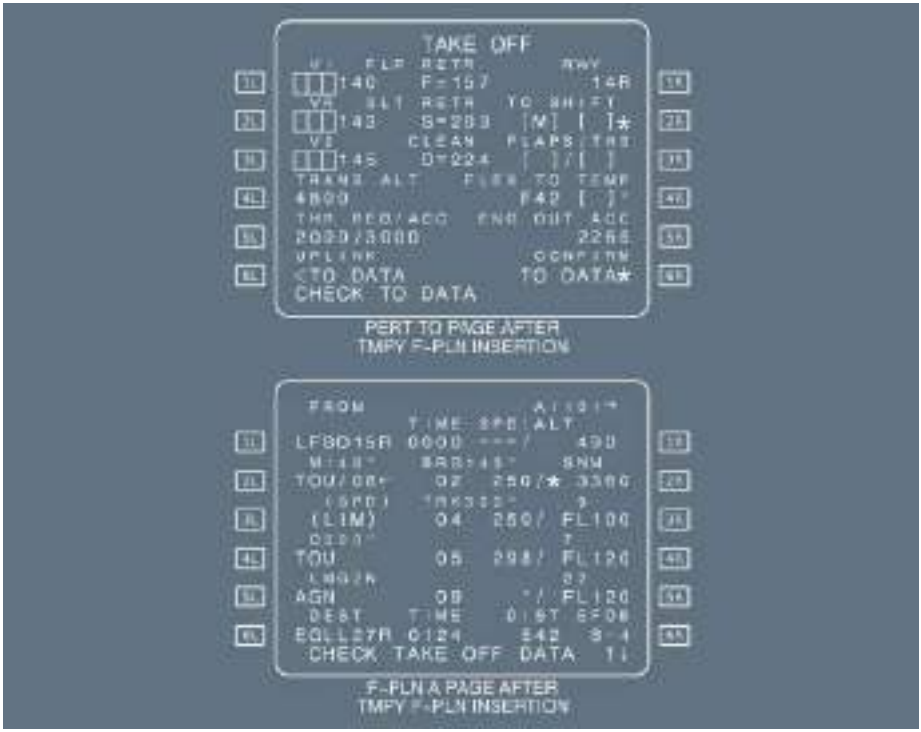
[1] **Applicable to: MSN 01767-01920, 02108, 02275-02334, 02388, 02457, 02584-02670, 02737-02804, 03750, 04491, 04532, 04645, 05120, 05218, 06720-09063**

PRESS the F-PLN key on the MCDU.
SELECT the LAT REV at origin.
SELECT the DEPARTURE prompt [1L].
SELECT the new RWY in use.
SELECT the appropriate SID and TRANS.
CHECK the resulting temporary F-PLN and INSERT it.

CHECK TAKE OFF DATA comes up in the scratchpad if the PERF TO page had been filled in.



ENTER the new V1, VR, V2, FLEX TEMP or CONF, as appropriate.



Note: *If the previously selected SID is compatible with the new runway, it automatically appears in the temporary flight plan. Any revision the pilot may have made to the previous SID will not be transferred.*
If the pilot still wants it, he has to reenter it.

CHANGE OF RUNWAY

Ident.: PRO-NOR-SRP-01-15-00003975.0015001 / 28 NOV 17

Applicable to: MSN 01957-02097, 02121-02204, 02359, 02405-02443, 02482, 02712, 02908-03618, 03782-04488, 04506-04518, 04535-04637, 04752-05094, 05155-05190, 05230-06336

PRESS the F-PLN key on the MCDU.
SELECT the LAT REV at origin.
SELECT the DEPARTURE prompt [1L].
SELECT the new RWY in use.

The "CHECK TAKE-OFF DATA" message is displayed.

CHECK/SELECT the appropriate SID and TRANS.
CHECK and INSERT the TMPY F-PLN, or continue with next revision.
PRESS the PERF key to access PERF TAKEOFF page.
CHECK the V1, VR, V2 and FLEX values displayed after the amber boxes. If these values are correct, PRESS [6R] to confirm and insert them. Else, ENTER new values.
ENTER the new V1, VR, V2, FLEX TEMP or CONF, as appropriate.

The previously-entered values, adjacent to the boxes, may be re-selected by pressing the CONFIRM TO DATA on [6R].*

Note: In case of a runway change, any previous lateral modification performed on the active DEPARTURE procedure may lead to additional waypoint stacking in the temporary F-PLN. The crew has to check and revise it, as necessary.

TAKEOFF FROM INTERSECTION

Ident.: PRO-NOR-SRP-01-15-00003976.0001001 / 09 DEC 09
Applicable to: ALL

Use RTOW or FCOM to revise takeoff parameters :
PRESS the [PERF] key on MCDU
ENTER the takeoff shift
ENTER the new V1, VR, V2, FLX TEMP, or CONF, as appropriate

Note: The insertion of the shift in takeoff position permits the system to make an accurate revision to its navigation data at takeoff.

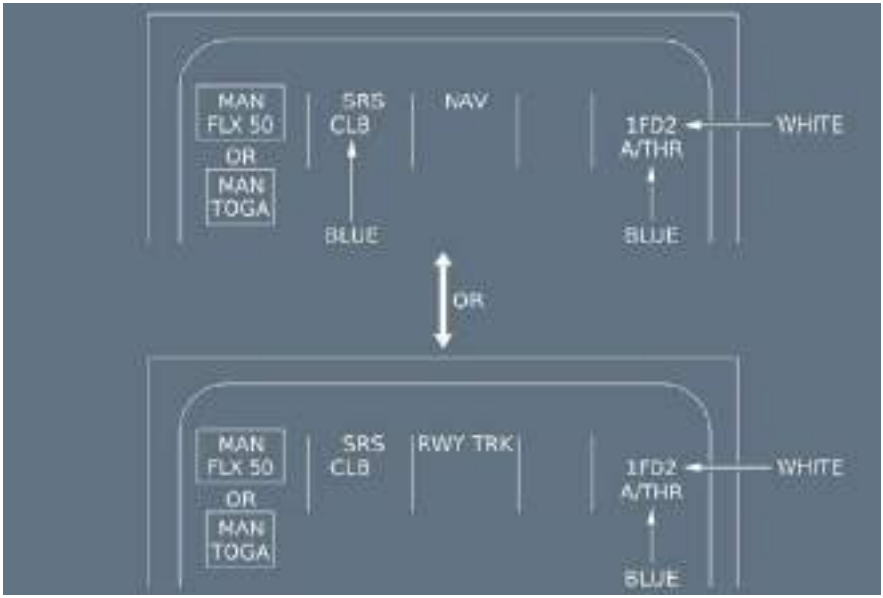
Takeoff

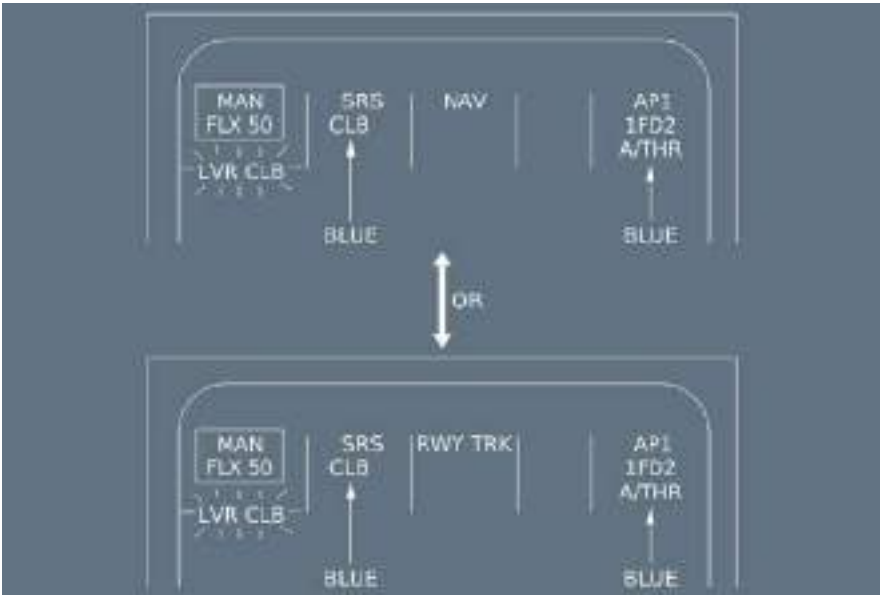
MONITORING THE TAKEOFF



Ident.: PRO-NOR-SRP-01-30-00003983.0007001 / 09 OCT 12
Applicable to: ALL

- **At power set (thrust levers in FLX or TOGA position)**
  CHECK that the navigation is updated to the runway threshold by verifying that the aircraft symbol is centered on the runway threshold of the navigation display.
  CHECK the FMA for appropriate mode selection

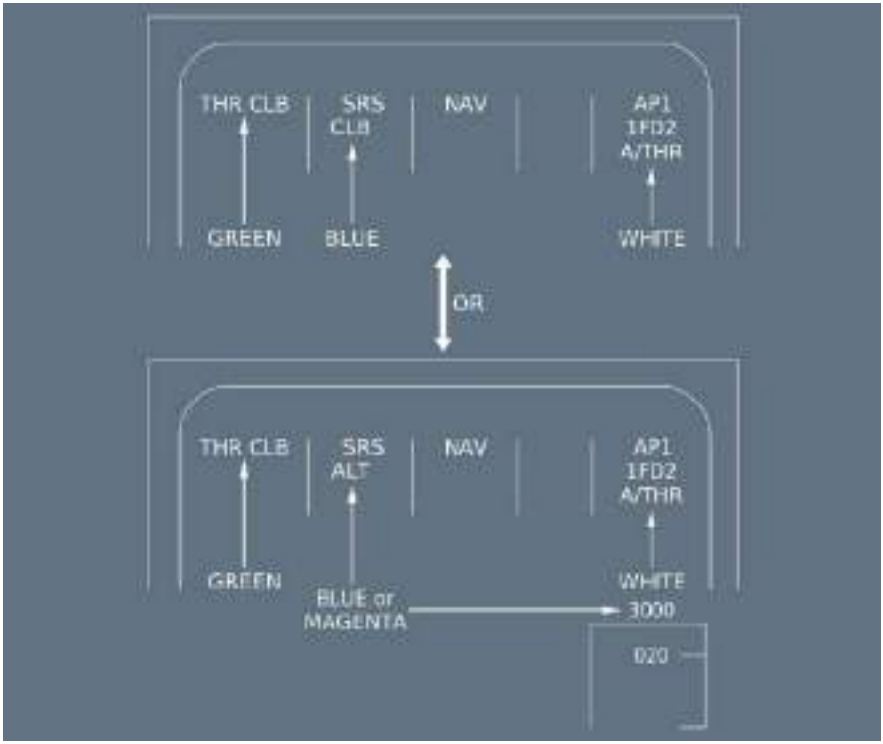
  Note: - *RWY mode appears if an ILS is tuned to a station corresponding to the departure runway. Otherwise no lateral mode comes up until the aircraft has lifted off.*



- **At 30 ft**
  - **If NAV is armed,** it engages automatically.
  - **If NAV is not armed,** RWY TRK mode engages and remains displayed until the crew selects another lateral mode.

- **At 100 ft**
  Engage AP1 or AP2.
  The FMGS has an internal delay that prevents the AP from engaging 5 s after liftoff and if the aircraft is below 100 ft.

- **At thrust reduction altitude**
  "LVR CLB" flashes in the first column of the FMA



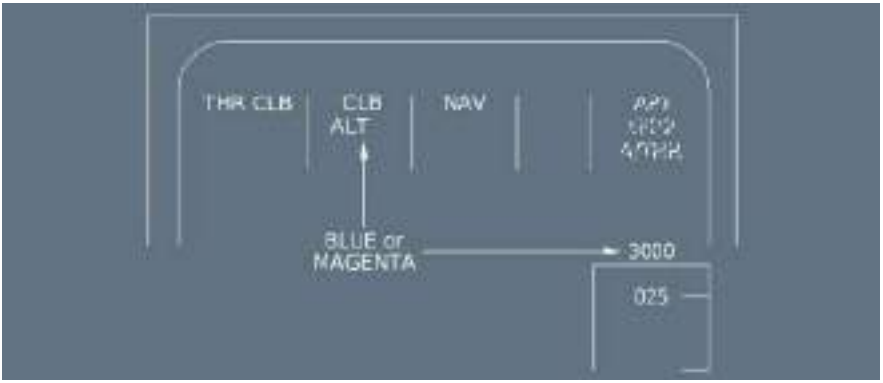
Procedure

SET the thrust levers to the CL detent

A/THR activates automatically

CHECK that A/THR turns to white in the 5th FMA column.

CHECK that THR CLB appears in green in the first column.



Depending on the next level off altitude, CLB or ALT is armed and displayed in the second column.

ALT is armed:

- *in blue if the next predicted level-off is the FCU-selected altitude (target altitude blue at the top of the ALT scale)*
- *in magenta if the next predicted level-off is an ALT CSTR (target altitude magenta at the top of the ALT scale)*

● **At acceleration altitude**

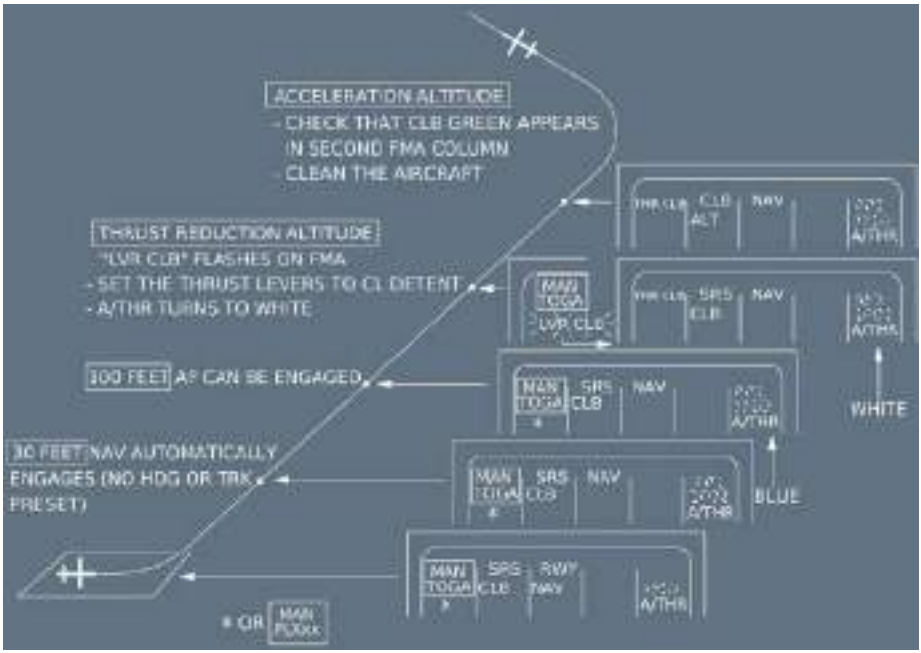
The vertical phase automatically switches to climb.
CLB mode engages. The target speed jumps to initial climb speed on the PFD.

Procedure

CHECK that “CLB” appears in green in the second FMA column.

- *The speed reference system (SRS) mode remains engaged until CLB phase is engaged, which occurs at ACCEL ALT or at any other vertical mode engagement, whichever comes first.*
- *If during takeoff the FCU altitude is set below the current aircraft altitude, the system ignores the FCU altitude and the aircraft remains in SRS mode until the pilot selects an altitude above the aircraft altitude or engages any other mode.*

PRESELECTING A HDG OR A TRK



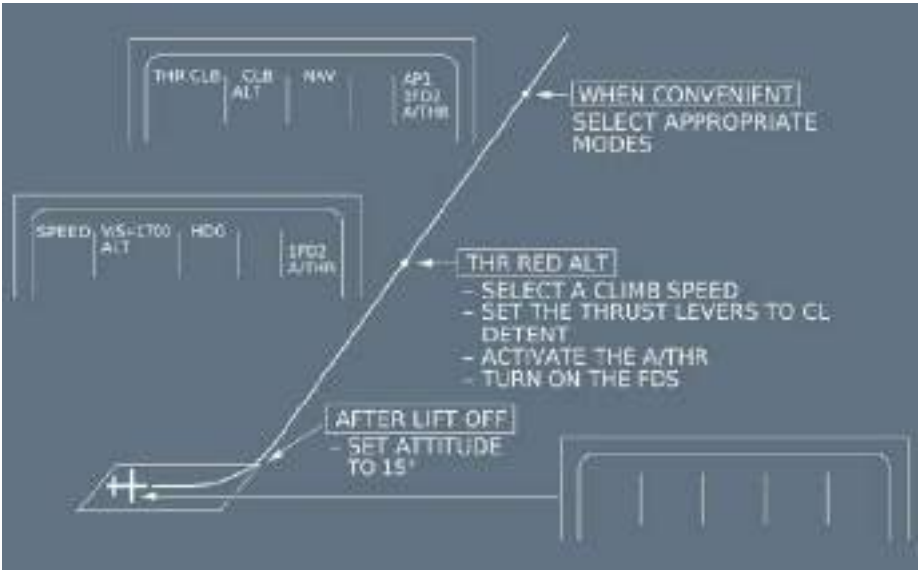
Ident.: PRO-NOR-SRP-01-30-00003984.0001001 / 16 NOV 11
Applicable to: ALL

PROCEDURE

- **If a HDG or a TRK was preselected on the ground :**
  PULL OUT the HDG/TRK selector knob when required
  CHECK that the HDG/TRK mode is active and displayed on the FMA
  When a HDG or TRK is preset, OP CLB mode will engage at the acceleration altitude. (CLB mode is not available in HDG/TRK mode).

NORMAL TAKEOFF PROFILE

Ident.: PRO-NOR-SRP-01-30-00003985.0002001 / 22 MAY 12
Applicable to: ALL



NO FLIGHT DIRECTOR TAKEOFF

Ident.: PRO-NOR-SRP-01-30-00003986.0004001 / 09 OCT 12
Applicable to: ALL

If a takeoff is initiated without FDs, the system responds as follow:

- There are no FD bars.
- There is no A/THR arming.
- There is no guidance available.
- The target speed on the PFD is that selected on the FCU or is defaulted to 100 kt.
- Setting the thrust levers to the CL detent does not activate A/THR.

Note: *Do not engage the autothrust prior to selecting a target speed on the FCU.*

PROCEDURE

Establish initial climb of 15 °

- **When reaching the thrust reduction altitude (THR RED ALT):**
  SELECT a climb speed.
  SET the thrust levers to CL detent.
  ACTIVATE the autothrust.
  TURN ON the FDs (basic modes engage).
  SELECT appropriate mode.
  Failure of both FDs after the start of takeoff:

  - *The FD bars disappear.*
  - *The FCU window displays the target speed, which synchronizes on V2, or the current speed (if it is higher).*
  - *The autothrust remains armed.*
  - *At thrust reduction altitude, LVR CLB flashes. If the pilot set the thrust levers to the CLB detent, the autothrust becomes active in selected SPD mode (no FDs selected).*
    If the current speed is greater than the target speed, the thrust decreases.
  - *At acceleration altitude the target speed does not change, since it is selected.*

TAKEOFF WITH NO V2 ENTRY

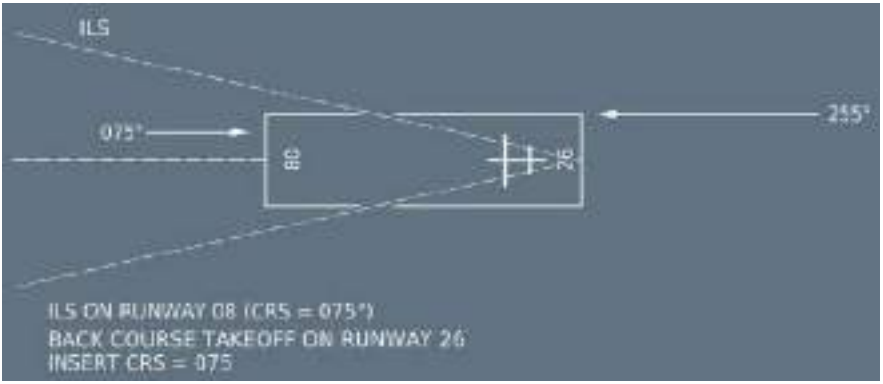
Ident.: PRO-NOR-SRP-01-30-00003987.0001001 / 16 NOV 11
Applicable to: ALL

If V2 is not inserted, the speed reference system (SRS) will not engage for takeoff.
5 s after lift off, V/S mode will engage. When V/S engages the current airspeed becomes the FCU target speed.

To regain a normal speed target, the pilot must :

SELECT the appropriate climb speed on the FCU and PULL out the knob.

- **At ACC ALT :**
  PUSH the A/THR pb on the FCU.
  SET the thrust levers to CL detent.
  PUSH in the SPD selector knob to get a managed speed target.



TAKEOFF USING THE LOCALIZER OF THE OPPOSITE RUNWAY

Ident.: PRO-NOR-SRP-01-30-00003988.0003001 / 09 OCT 12
Applicable to: MSN 01767-01920, 02108, 02135, 02139-02195, 02359-02405, 02482, 02609-02626, 03308, 03357-03618, 03782-04216, 04312, 04328-04384, 04481-04488, 04506, 04518, 04535-04637, 04752-04954

- **If the localizer, of the ILS associated with the opposite runway, must be used for takeoff:**
  SELECT the RAD NAV PAGE.
  ENTER the ILS IDENT.
  If the ILS is in the database, the system tunes the proper frequency.
  Check that the ILS front course is displayed in the CRS field.

  Note: This may trigger the "RWY/ILS MISMATCH" message. Disregard it.

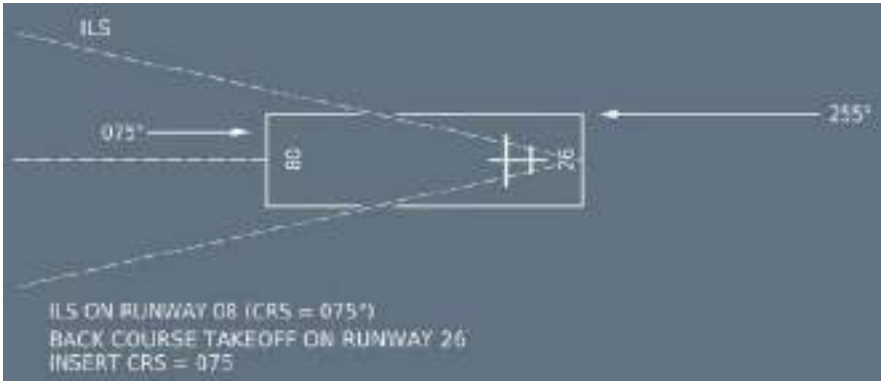
- **If the ILS is not in the database:**
  SET the appropriate frequency, and SET the ILS front course in the CRS field.

DESELECT the LS pb on the FCU.

Since the PFD displays reverse deviation.

SELECT ROSE ILS on one ND.

TAKEOFF USING THE LOCALIZER OF THE OPPOSITE RUNWAY



Ident.: PRO-NOR-SRP-01-30-00003988.0005001 / 09 OCT 12

[1] **Applicable to: MSN 01957-02097, 02121, 02138, 02204-02334, 02443-02457, 02584, 02649-03264, 03330, 03750, 04294, 04314, 04393-04438, 04491, 04510, 04532, 04645, 04965-09063**

- **If the localizer, of the ILS associated with the opposite runway, must be used for takeoff:**
  SELECT the RAD NAV PAGE.
  ENTER the ILS IDENT.
  If the ILS is in the database, the system tunes the proper frequency.
  Check that the ILS front course is displayed in the CRS field.

  Note: This may trigger the "RWY/ILS MISMATCH" message. Disregard it.

- **If the ILS is not in the database:**
  SET the appropriate frequency, and SET the ILS front course in the CRS field.

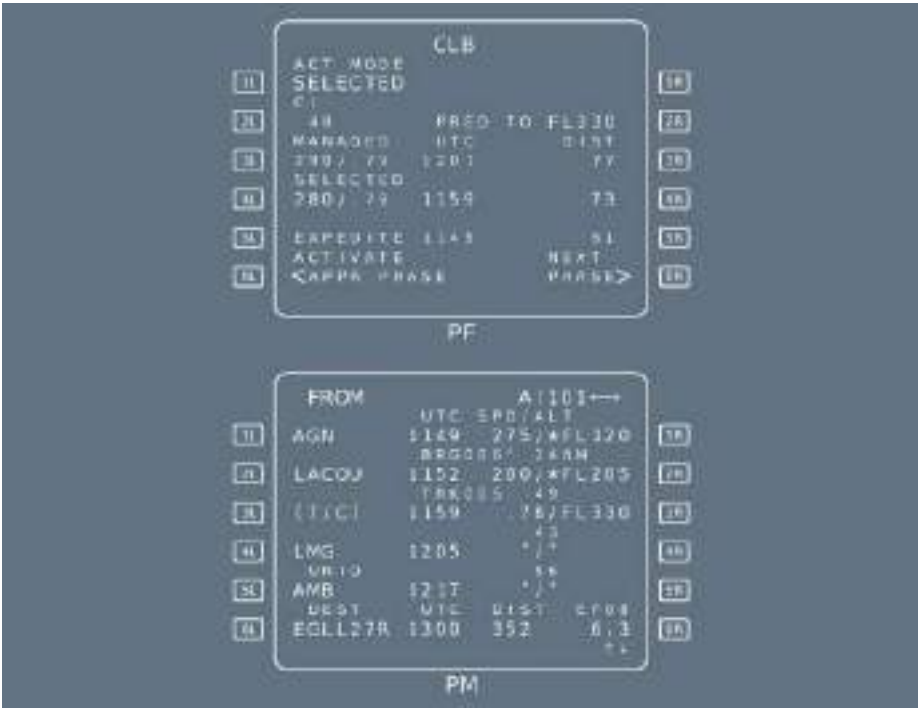
DESELECT the LS pb on the FCU.

Since the PFD displays reverse deviation.

DESELECT the LS pb on ISIS.

Since ISIS displays LOC reverse deviation.

SELECT ROSE-ILS on one ND.

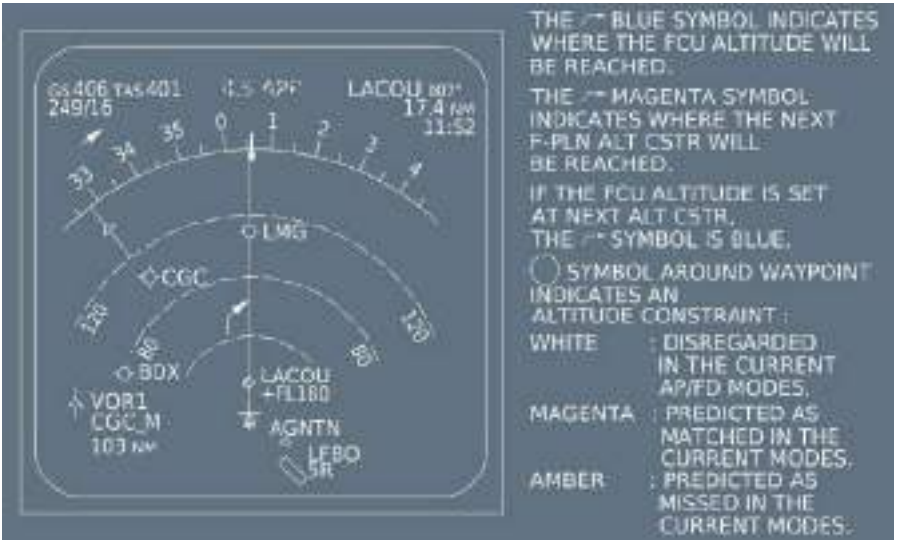


Climb

MONITORING THE CLIMB PHASE

Ident.: PRO-NOR-SRP-01-40-00003989.0031001 / 05 JUN 18

[1] **Applicable to: MSN 01767-01920, 02108, 02275-02334, 02388, 02457, 02584-02670, 02737-02804, 03750, 04491, 04532, 04645, 05120, 05218, 06720-09063**

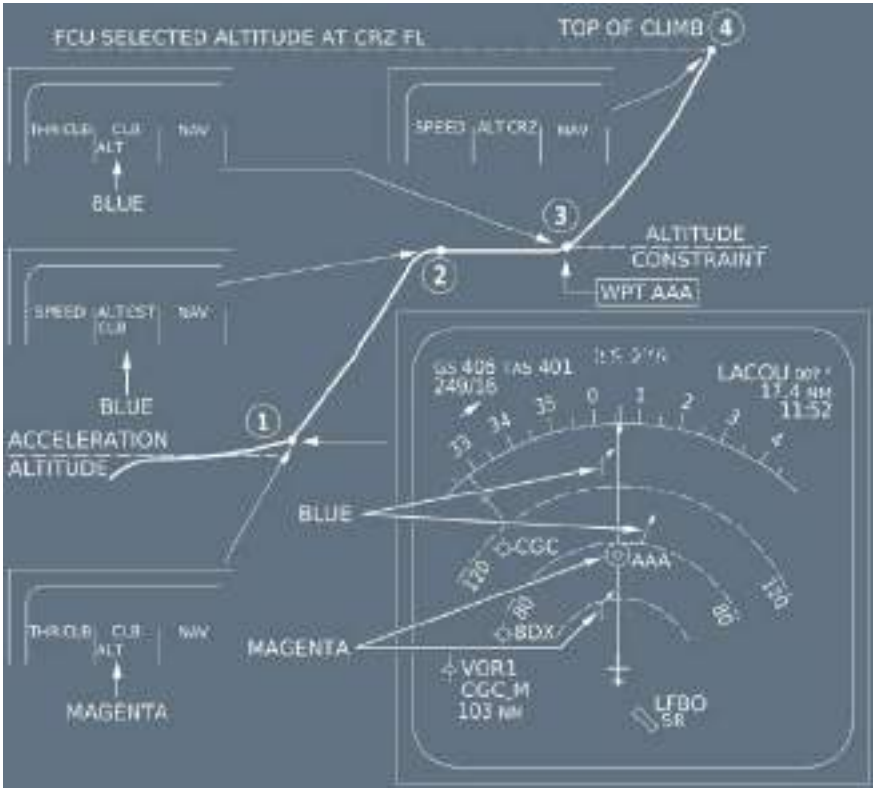


The PF MCDU should display the PERF CLB page allowing him to monitor the climb.
The PM MCDU should display the F-PLN page to allow the pilot to monitor time, speed and altitude predictions. This page also displays matched or missed information for constraints.

CHECK vertical mode CLB if NAV is engaged.
CHECK vertical mode OP CLB if HDG/TRK is engaged.

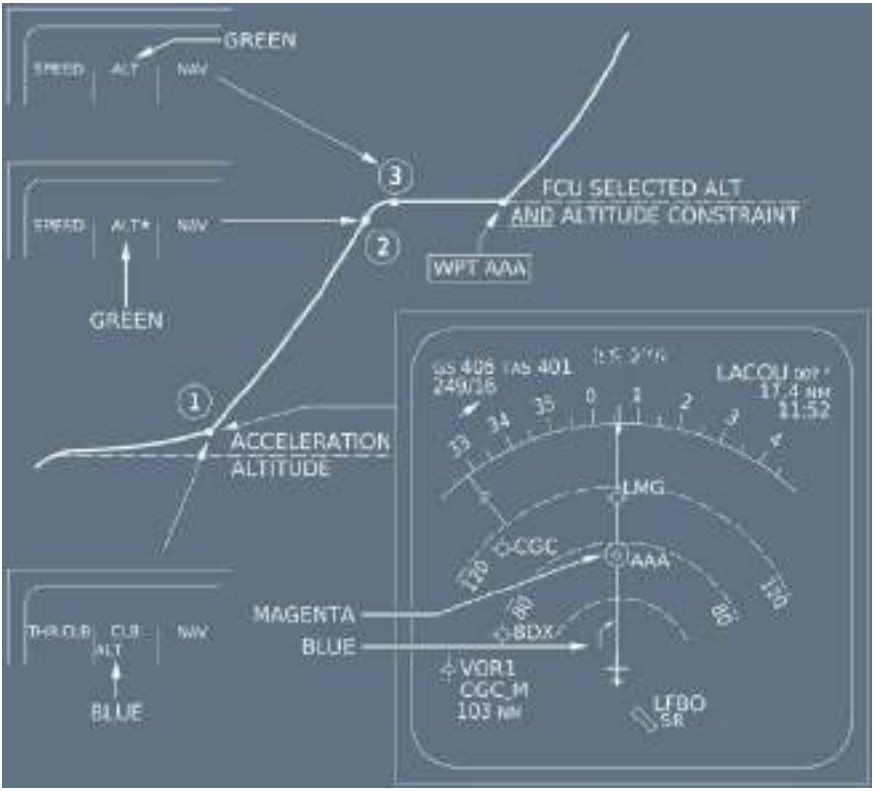
MONITORING THE ND (ROSE NAV OR ARC)

Displays the lateral and vertical paths, in the current AP/FD active modes.



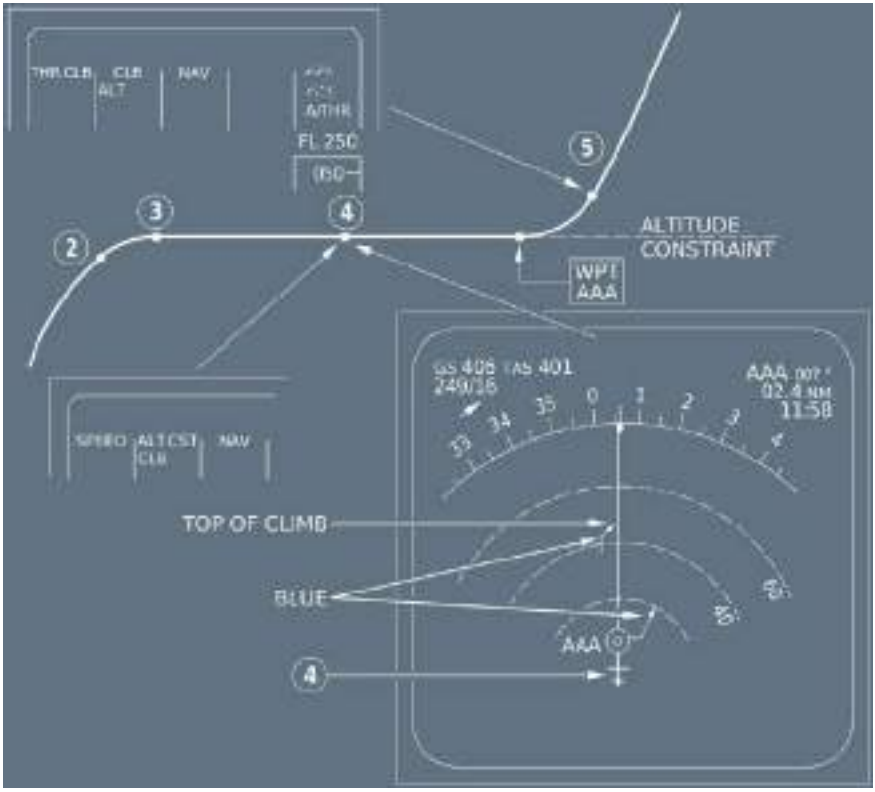
MONITORING THE AP/FD MODES AND FMA

If CLB mode is engaged, the flight mode annunciator (FMA) and the navigation display (ND) show the tactical situation as follows:



CASE 1

The FCU selected altitude is set above the next altitude constraint



CASE 2

The FCU selected altitude is set at the next altitude constraint
The aircraft will automatically levels off at this altitude.

To resume the climb automatically when the waypoint AAA is reached, apply the following procedure during the level off (Position 4):

SELECT the FCU altitude to the next constraint (if any) or the cruise FL.
PUSH the FCU ALT selector knob to arm CLB mode.

RECOMMENDATION:

To ensure that you will not miss the next constraint, it is recommended to select the FCU altitude to the next constraint as described above.

MONITORING THE CONSTRAINTS

SPEED, ALTITUDE and TIME constraint can be checked using MCDUs. Each constraint is preceded by a star that indicates if the constraint is matched (magenta star) or missed (amber star).

ALTITUDE CONSTRAINT

- **If an altitude constraint is predicted as missed,** use the following procedure:

SET the FCU ALT to the next ALT CSTR
CHECK the position of the level off symbol on the ND (blue arrow) with respect to the waypoint with the constraint.
DECREASE the target speed until the constraint is met.

SPEED CONSTRAINT

CHECK the SPD CSTR predictions on the MCDU.

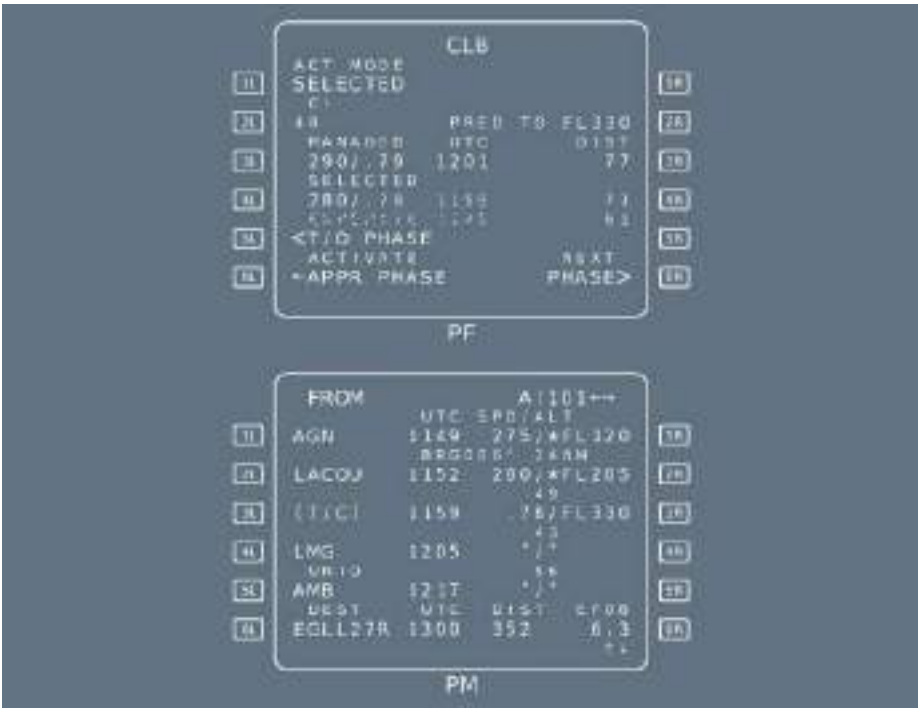
A magenta or amber star (*) indicates that the aircraft will match or miss the constraint.
If the aircraft is to miss the constraint by more than 10 kt, the MCDU scratchpad displays "SPD ERROR AT WPT ---- ".

"CHECK WEIGHT" MESSAGE.

Refer to DSC-22_20-90-20 "CHECK WEIGHT" Message

HDG/TRK MODE ENGAGEMENT

- **If HDG/TRK is engaged,** the guidance does not consider any F-PLN constraint. Therefore if the flight crew disengages NAV, CLB mode reverts to OP CLB.



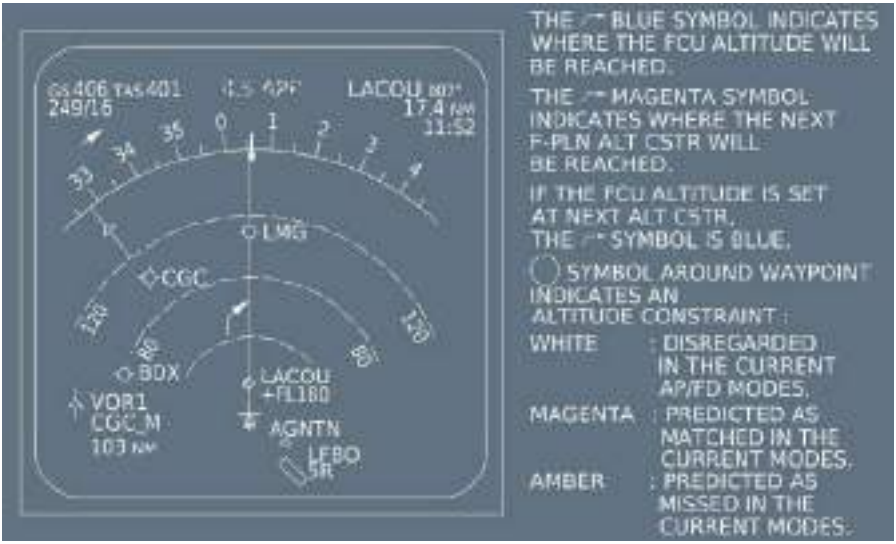
SPEED SELECTION

- **If a specific speed is required:**
  TURN and PULL the SPD selector knob. (This changes the target speed to blue on the PFD speed scale).
  Predictions on the F-PLN page assume that the speed remains selected until the next SPD LIM or SPD CSTR, or the next phase, whichever comes first.

MONITORING THE CLIMB PHASE

Ident.: PRO-NOR-SRP-01-40-00003989.0025001 / 28 NOV 17
Applicable to: MSN 01957-02097, 02121-02204, 02359, 02405-02443, 02482, 02712, 02908-03618, 03782-04488, 04506-04518, 04535-04637, 04752-05094, 05155-05190, 05230-06336

The PF MCDU should display the PERF CLB page allowing him to monitor the climb.
The PM MCDU should display the F-PLN page to allow the pilot to monitor time, speed and altitude predictions. This page also displays matched or missed information for constraints.

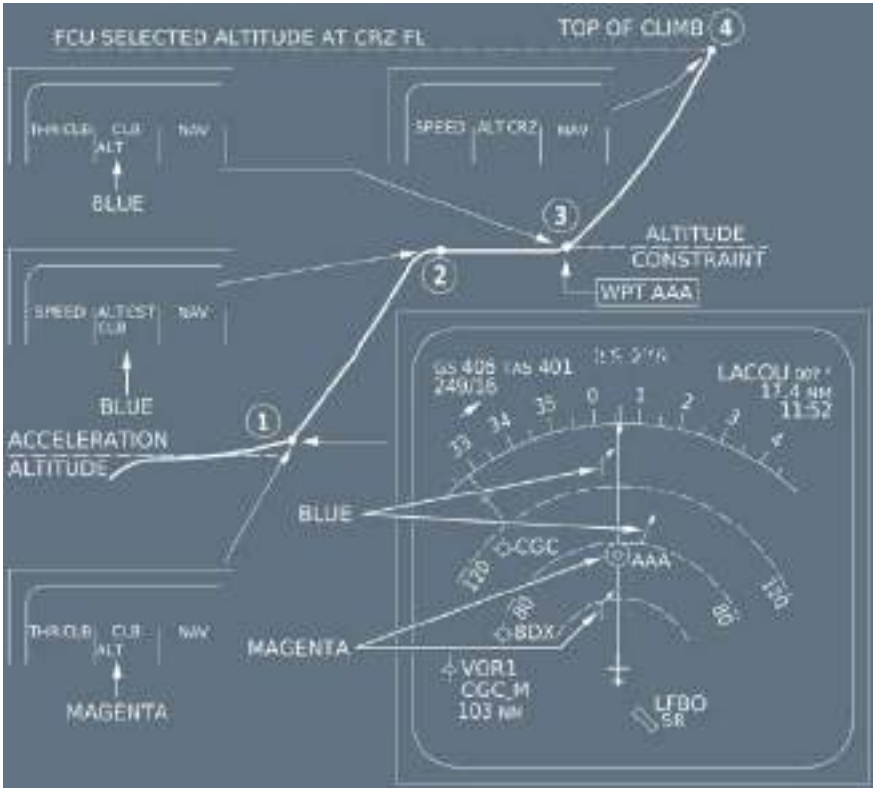


CHECK vertical mode CLB if NAV is engaged.

CHECK vertical mode OP CLB if HDG/TRK is engaged.

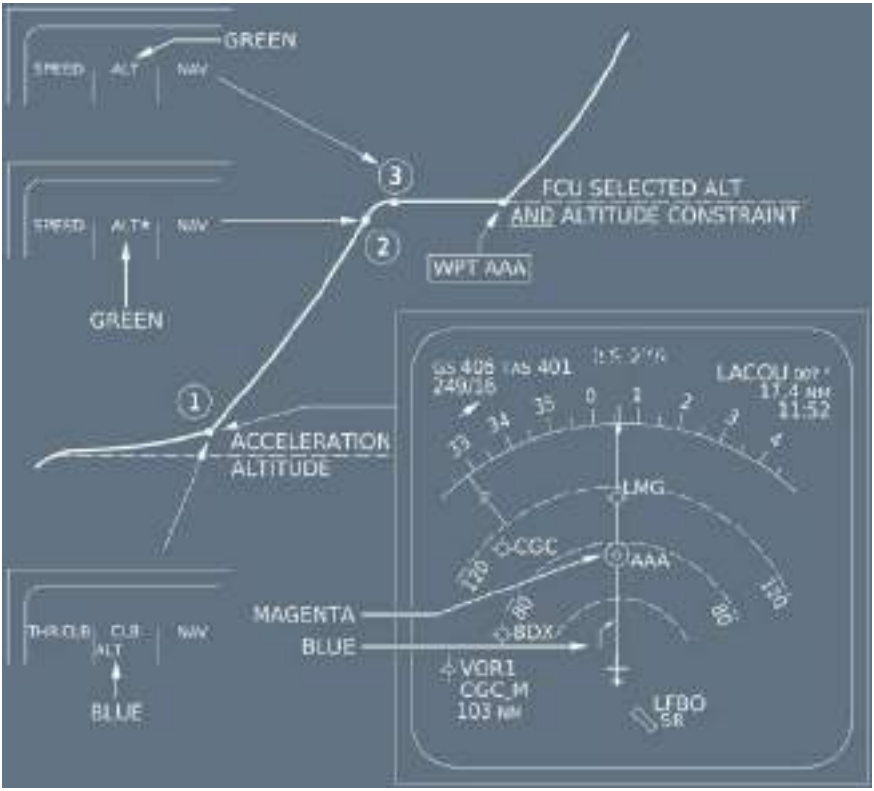
MONITORING THE ND (ROSE NAV OR ARC)

Displays the lateral and vertical paths, in the current AP/FD active modes.



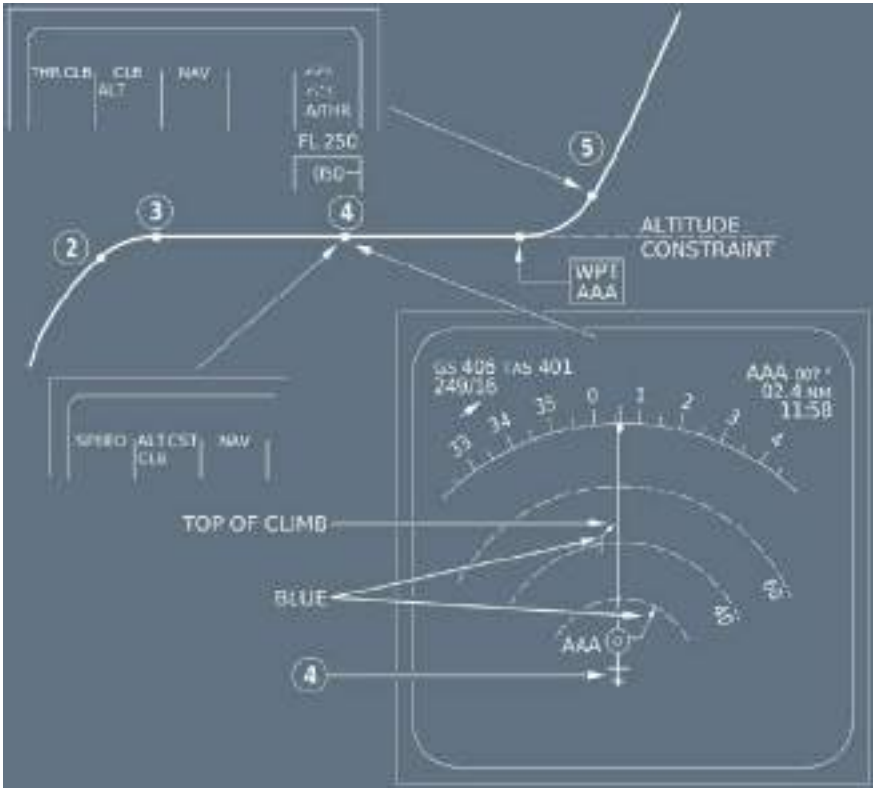
MONITORING THE AP/FD MODES AND FMA

If CLB mode is engaged, the flight mode annunciator (FMA) and the navigation display (ND) show the tactical situation as follows:



CASE 1

The FCU selected altitude is set above the next altitude constraint



CASE 2

The FCU selected altitude is set at the next altitude constraint
The aircraft will automatically levels off at this altitude.

To resume the climb automatically when the waypoint AAA is reached, apply the following procedure during the level off (Position 4):

SELECT the FCU altitude to the next constraint (if any) or the cruise FL.
PUSH the FCU ALT selector knob to arm CLB mode.

RECOMMENDATION:

To ensure that you will not miss the next constraint, it is recommended to select the FCU altitude to the next constraint as described above.

MONITORING THE CONSTRAINTS

SPEED, ALTITUDE and TIME constraint can be checked using MCDUs. Each constraint is preceded by a star that indicates if the constraint is matched (magenta star) or missed (amber star).

ALTITUDE CONSTRAINT

- **If an altitude constraint is predicted as missed,**
  use the following procedure:

SET the FCU ALT to the next ALT CSTR
CHECK the position of the level off symbol on the ND (blue arrow) with respect to the waypoint with the constraint.
DECREASE the target speed until the constraint is met.

SPEED CONSTRAINT

CHECK the SPD CSTR predictions on the MCDU.

A magenta or amber star (*) indicates that the aircraft will match or miss the constraint.
If the aircraft is to miss the constraint by more than 10 kt, the MCDU scratchpad displays "SPD ERROR AT WPT ---- ".

"CHECK WEIGHT" MESSAGE.

Refer to DSC-22_20-90-20 "CHECK WEIGHT" Message

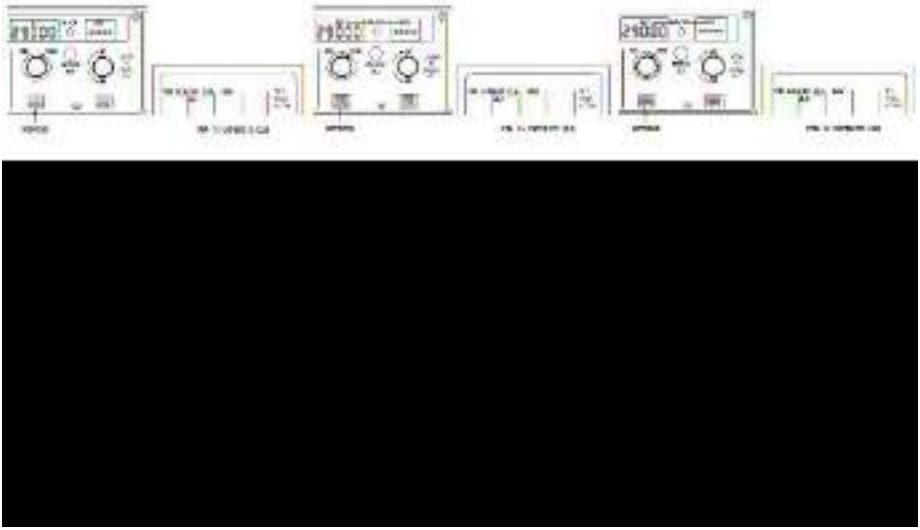
HDG/TRK MODE ENGAGEMENT

- **If HDG/TRK is engaged,** the guidance does not consider any F-PLN constraint. Therefore if the flight crew disengages NAV, CLB mode reverts to OP CLB.

SPEED SELECTION

- **If a specific speed is required:**
  TURN and PULL the SPD selector knob. (This changes the target speed to blue on the PFD speed scale).
  Predictions on the F-PLN page assume that the speed remains selected until the next SPD LIM or SPD CSTR, or the next phase, whichever comes first.

EXPEDITE CLIMB



Ident.: PRO-NOR-SRP-01-40-00003990.0002001 / 11 FEB 11

[2] **Applicable to: MSN 01767-02195, 02275-02405, 02457-02649, 02712-02737, 02908-03138, 03308, 03357-09063**

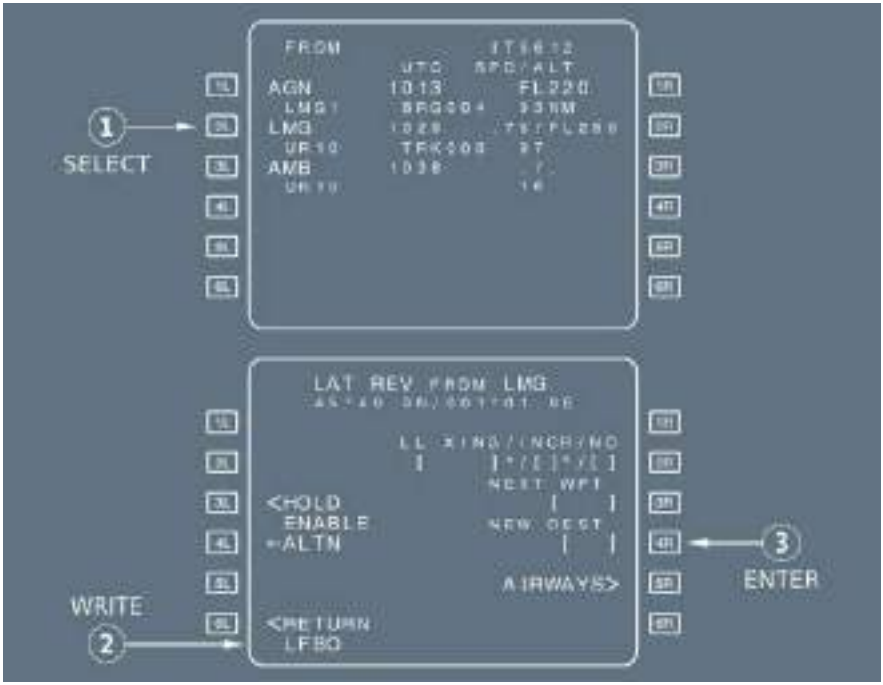
The flight may use the expedite mode temporarily to clear a specified altitude or to match a constraint.

PRESS EXPED pb on the FCU.

The AP acquires and maintains Green Dot speed. There is no benefit to use expedite mode above FL 250. The mach corresponding to green dot is too low to maintain an increased vertical speed.

To revert to normal climb:
PUSH ALT knob CLB mode will engage.

Note: *Pulling ALT knob or V/S knob or SPD/MACH knob also disengages EXPEDITE. PRESSING EXPED pb never disengages the mode.*



IMMEDIATE RETURN TO ORIGIN AIRPORT

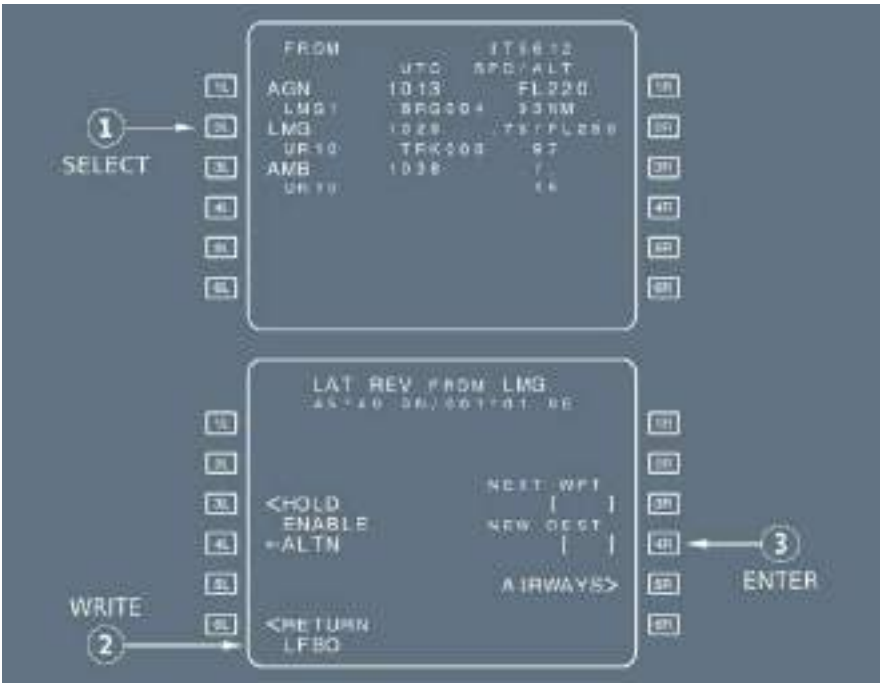
Ident.: PRO-NOR-SRP-01-40-00003991.0003001 / 23 JUN 15

3 **Applicable to: MSN 01767-01920, 02108, 02275-02334, 02388, 02457, 02584-02670, 02737-02804, 03750, 04491, 04532, 04645, 05120, 05218, 06720-09063**

- **If the SEC F-PLN has been prepared for an immediate return to the airport of origin:**
  ACTIVATE the SEC F-PLN.
  PERFORM a DIR TO the appropriate waypoint.

- **If the SEC F-PLN has not been prepared for an immediate return to the airport of origin:**

PERFORM a lateral revision at TO waypoint
ENTER the departure airport ident in the NEW DEST field and INSERT the temporary flight plan.
PERFORM a lateral revision at the new destination
SELECT: APPR – STAR – VIA – TRANS and INSERT



- **When cleared to divert:**
  PERFORM a DIR TO the suitable waypoint.
  ENTER QNH, WIND, MDA/MDH, LDG CONF.
  CHECK RAD NAV page.

IMMEDIATE RETURN TO ORIGIN AIRPORT

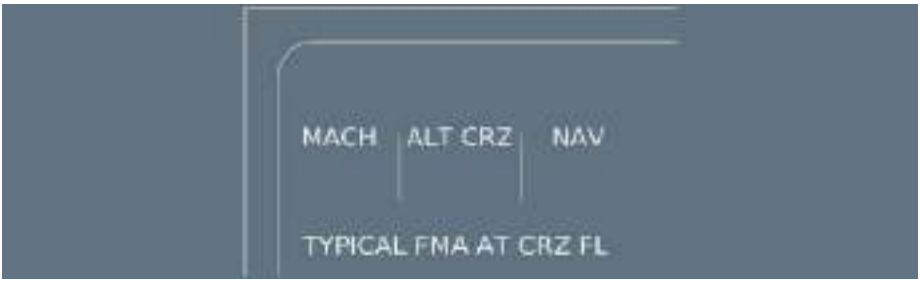
Ident.: PRO-NOR-SRP-01-40-00003991.0007001 / 23 JUN 15
Applicable to: MSN 01957-02097, 02121-02204, 02359, 02405-02443, 02482, 02712, 02908-03618, 03782-04488, 04506-04518, 04535-04637, 04752-05094, 05155-05190, 05230-06336

- **If the SEC F-PLN has been prepared for an immediate return to the airport of origin:**
  REVERT to HDG mode, then ACTIVATE the SEC F-PLN.
  PERFORM a DIR TO the appropriate waypoint.

- **If the SEC F-PLN has not been prepared for an immediate return to the airport of origin:**

PERFORM a lateral revision at TO waypoint
ENTER the departure airport ident in the NEW DEST field.
PERFORM a lateral revision at the new destination

SELECT: APPR – STAR – VIA – TRANS and INSERT
CHECK and INSERT the TMPY F-PLN or continue with next revision.



■ **When cleared to divert:**
PERFORM a DIR TO the suitable waypoint.
ENTER QNH, WIND, MDA/MDH, LDG CONF.
CHECK RAD NAV page.

Cruise

REACHING CRUISE FLIGHT LEVEL

Ident.: PRO-NOR-SRP-01-50-00003992.0002001 / 03 NOV 14
Applicable to: ALL

On reaching the cruise flight level, the flight crew should be sure that the FMA displays “ALT CRZ” in its second column, which ensures that the aircraft is at cruise flight level and at Economy Cruise Mach (ECON CRZ MACH).

The FMGS engages the “soft altitude” (SOFT ALT) mode 2 min after the cruise flight level is captured and Mach stabilized. (SOFT ALT) mode allows the aircraft to deviate ± 50 ft from the target altitude to minimize the thrust variation and reduce the fuel consumption.

- **If the FMA does not display ALT CRZ at the assigned flight level,** soft altitude mode will not engage and the predictions will be computed at the preplanned flight level. This will occur when the ATC assigned flight level is lower than the preplanned flight level entered on the PROG page.

- **If the FMA does not display ALT CRZ at the assigned FL (as may occur when the ATC-assigned FL is lower than the preplanned FL selected initially):**
  PRESS the [PROG].
  ENTER the current cruise flight level.

  Note: If the current cruise flight level is above the preplanned FL, selecting the FCU updates it automatically.

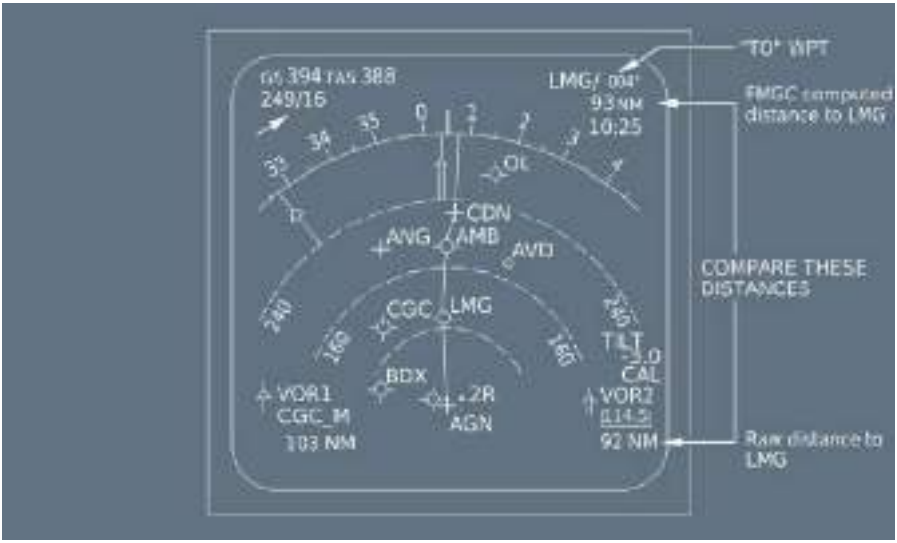
“SET SPD AUTO” OR “SET MANAGED SPD” OR “CHECK SPEED MODE”

- **If the climb phase was flown in selected speed and if the cruise phase is planned to be flown in managed speed (ECON MACH/SPEED)** , “SET SPD AUTO” or “SET MANAGED SPEED” or "CHECK SPEED MODE" appears on the PFD and MCDU as a reminder.

PRESS the FCU speed selector knob to activate the managed Mach.

MONITORING THE NAVIGATION ACCURACY

Ident.: PRO-NOR-SRP-01-50-A-00003993.0001001 / 22 MAY 12
Applicable to: ALL



GENERAL

On aircraft equipped with GPS PRIMARY, the navigation accuracy check is not required as long as GPS PRIMARY ◁⋕ is available.
Otherwise, navigation accuracy shall be checked periodically in cruise.

The PROG page displays an estimated accuracy as being high or low (center of sixth line):
- "HIGH" means that the FMGS estimates the FM position accurate enough to meet the EN ROUTE criteria,
- "LOW" means that the pilot must compare raw data from tuned navaids with corresponding data computed by FM and shown on the ND or MCDU PROG page. The appearance of the message "NAV ACCUR DOWNGRAD" on the MCDU calls for a similar crosscheck.

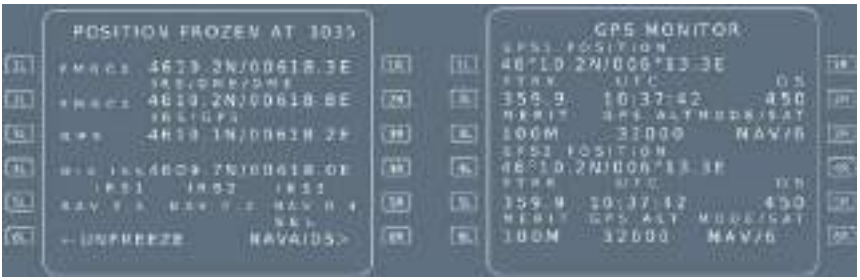
Note: *The pilot should make such a comparison periodically, even if the PROG page is displaying "HIGH" and navaids are available: this allows him to quantify the FM position error.*

The method for checking the accuracy is explained in the SOP and in Evaluation of position accuracy chapter (*Refer to DSC-22_20-20-20 General*).
A quick check is explained here below when the TO waypoint is a DME type. (VOR/DME or VOR/TAC or DME or TAC)

Ident.: PRO-NOR-SRP-01-50-A-00003994.0013001 / 22 NOV 11

[1] **Applicable to: MSN 01767-01920, 02108, 02275-02334, 02388, 02457, 02584-02670, 02737-02804, 03750, 04491, 04532, 04645, 05120, 05218, 06720-09063**

POSITION DISCREPANCY



- **If there is a discrepancy between the raw data position and the FM position:**
  PRESS the DATA key on the MCDU.
  SELECT the POSITION MONITOR page.
  SELECT “FREEZE”.
  On the other MCDU : Select the GPS MONITOR page.

Ident.: PRO-NOR-SRP-01-50-A-00003994.0014001 / 14 FEB 11
Applicable to: MSN 01957-02097, 02121-02204, 02359, 02405-02443, 02482, 02712, 02908-03618, 03782-04488, 04506-04518, 04535-04637, 04752-05094, 05155-05190, 05230-06336

POSITION DISCREPANCY

- **If there is a discrepancy between the raw data position and the FM position:**
  PRESS the DATA key on the MCDU.
  SELECT the POSITION MONITOR page.
  SELECT "FREEZE".
  On the other MCDU: Select the GPS MONITOR page.

MONITORING THE FUEL PREDICTIONS

Ident.: PRO-NOR-SRP-01-50-00003995.0013001 / 14 FEB 11
Applicable to: ALL

The F-PLN and FUEL PRED pages display fuel and time predictions throughout the flight. These predictions are meaningful if the lateral and vertical flight plan, and the entered winds are kept accurate enough as the flight progresses.

PROCEDURE

In addition to the Fuel Management procedure described in the SOPs (*Refer to PRO-NOR-SOP-15 Cruise - Flight Progress*), periodically apply the following actions:

KEEP ACCURATE FMS PREDICTIONS

Periodically UPDATE the F-PLN elements (F-PLN waypoints, step altitudes, predicted winds).

CHECK the MIN DEST FOB value on the FUEL PRED page

The MIN DEST FOB value is computed by the FMS and by default it is equals to ALTN + FINAL. ALTN, FINAL and MIN DEST FOB can be modified by the flight crew.
At the beginning of the CRZ phase, and/or after any change of destination or alternate airport, check that the MIN DEST FOB value is meaningful. Otherwise, update the MIN DEST FOB value, as appropriate.

CHECK the DEST EFOB value on the F-PLN or FUEL PRED page

MONITOR the EFOB at destination on the F-PLN or FUEL PRED page. If necessary, ADAPT the flight strategy.

"DEST EFOB BELOW MIN" MESSAGE

If the predicted EFOB at destination becomes less than the MIN DEST FOB value displayed on the FUEL PRED page:

- The destination EFOB turns to amber on the F-PLN, FUEL PRED and PERF (CLB, CRZ, DES) pages, and REPORT page.
- The "DEST EFOB BELOW MIN" amber message is displayed on the MCDU scratchpad, after 2 min (if the FMS is in CRZ or DES phase).

Note: If the flight crew has cleared the "DEST EFOB BELOW MIN" message, and if the predicted EFOB at destination is still less than the MIN DEST FOB value, the "DEST EFOB BELOW MIN" message will appear again at the beginning of the descent phase.

PROCEDURE

- **If the "DEST EFOB BELOW MIN" message is triggered on the MCDU:**

  CHECK the DEST EFOB value on the F-PLN or FUEL PRED page,

  CHECK the hypothesis used by the FMS to compute the fuel predictions,

  Check that the F-PLN elements (F-PLN waypoints, step altitudes, predicted winds) are up-to-date, to ensure that the FMS predictions are accurate.

  Check that the MIN DEST FOB fuel value is meaningful and corresponds to the planned fuel strategy.

  ADAPT the flight strategy as required.

ENTERING A STEP CLIMB OR A STEP DESCENT

Ident.: PRO-NOR-SRP-01-50-00003996.0002001 / 22 MAY 12

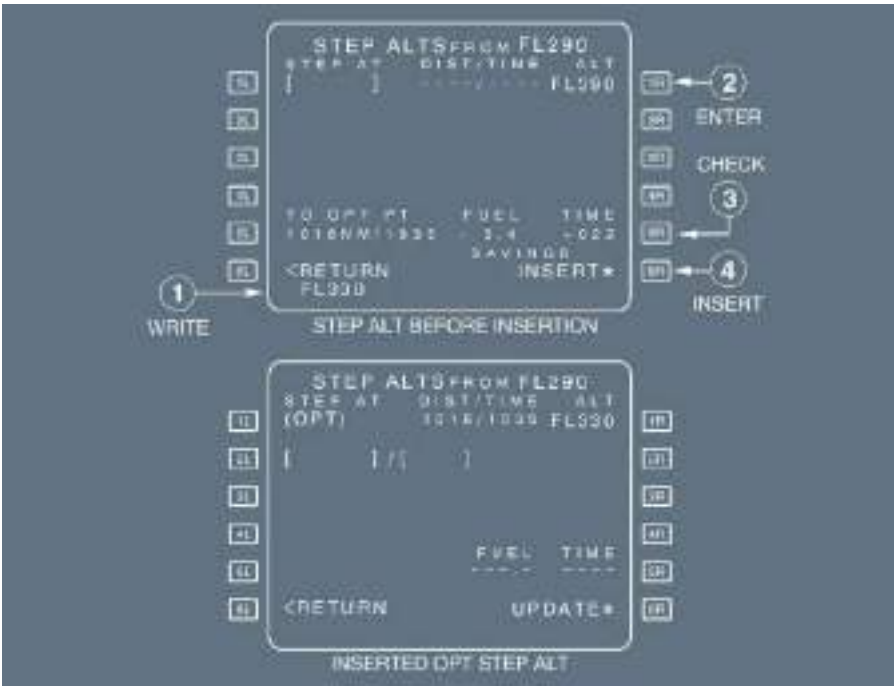
[2] **Applicable to: MSN 01767-01920, 02108, 02275-02334, 02388, 02457, 02584-02670, 02737-02804, 03750, 04491, 04532, 04645, 05120, 05218, 06720-09063**

The crew may use the STEP ALTS page to enter up to four geographic step points or one optimal step (computed by the FMGS) at any waypoint of the cruise.

PROCEDURE

PRESS the PERF key.

SELECT "STEP ALTS" prompt.



The PERF PAGE displays this prompt in cruise phase. The crew may also call up the STEP ALTS page using a vertical revision at any cruise waypoint.

ENTERING AN OPTIMAL STEP (ONLY STEP CLIMB)

WRITE a step altitude or FL into the scratchpad.
ENTER the step altitude or FL in the [1R] field.
CHECK the FUEL and TIME SAVINGS predictions on the 5L and 5R fields.
PUSH the INSERT prompt [6R] if adequate.

After insertion, the optimum step climb is updated only when the flight crew presses the UPDATE prompt [6R].
The ND shows symbols for the start of climb (S/C) and the top of climb (T/C). The MCDU shows the associated pseudo-waypoints.
It is possible to convert an optimum step to a geographic step by overwriting the [1L] field (see geographic step).

- **When reaching the step climb pseudo-waypoint:**
  REQUEST climb clearance.
  ADJUST the FCU altitude to the STEP ALT, and PUSH.

ENTERING A GEOGRAPHIC STEP

WRITE a step altitude into the scratchpad.

The format is position/altitude (or FL). The position can be a waypoint or waypoint/distance to waypoint. The waypoint/distance is an along track offset waypoint.

ENTER it in [1L] to [4L] field.

The entry of the initial geographic step point requires both a valid waypoint and altitude entries. When a step has been entered, the flight crew may change the position and the altitude independently. The flight crew cannot modify the position and the altitude in a single entry: To modify both, they should modify the position first, and then the altitude.

CHECK the predictions

- **When reaching the step climb or descent pseudo-waypoint (S/C or S/D):**
  REQUEST climb or descent clearance.
  ADJUST the FCU altitude to the STEP ALT, and PUSH.

The DIST/TIME field may display the following messages:

- ABOVE MAX if the step altitude exceeds the MAX ALT.
- IGNORED if the start step point is less than 50 NM from the top of descent.
- STEP NOW when the aircraft is within 20 NM of the step point.
  If the aircraft overflies the step waypoint without commencing a climb or a descent, the system deletes the step from the vertical F-PLN automatically (a “STEP DELETED” message is displayed on the MCDU scratchpad), and recomputes the predictions.
  A step is not deleted if the FCU altitude is moved only partially towards the step altitude.
  The flight phase remains “cruise” whenever a step is initiated.

Note: For an altitude restriction defined at a waypoint less than 50 NM before the top of descent and lower than the CRZ FL, it is recommended to enter an altitude constraint rather than a step.

ENTERING A STEP CLIMB OR A STEP DESCENT

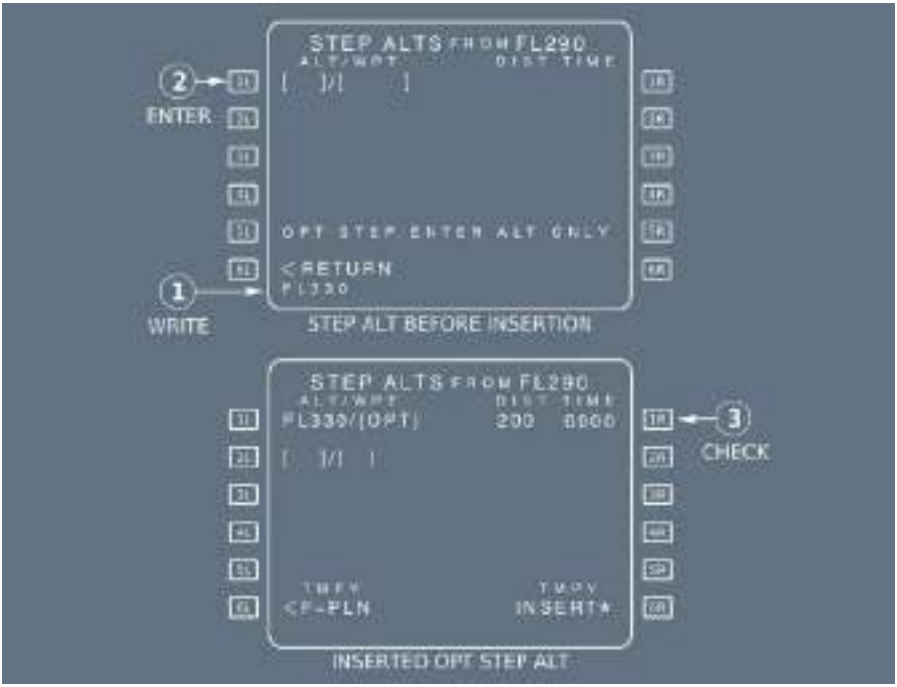
Ident.: PRO-NOR-SRP-01-50-00003996.0012001 / 22 MAY 12
Applicable to: MSN 01957-02097, 02121-02204, 02359, 02405-02443, 02482, 02712, 02908-03618, 03782-04488, 04506-04518, 04535-04637, 04752-05094, 05155-05190, 05230-06336

The crew may use the STEP ALTS page to enter up to four geographic step points or one optimal step (computed by the FMGS) at any waypoint of the cruise.

PROCEDURE

PRESS the F-PLN key on the MCDU.
SELECT the VERT REV page at any waypoint.
SELECT "STEP ALTS" prompt.

The PERF PAGE displays this prompt in cruise phase. The crew may also call up the STEP ALTS page using a vertical revision at any cruise waypoint.



ENTERING AN OPTIMAL STEP (ONLY STEP CLIMB)

WRITE the desired step altitude into the scratchpad.
ENTER it in the [1L] field

The FMGS automatically computes the optimal location of the step and inserts it in the TMPY F-PLN.

CHECK the FUEL and TIME SAVINGS predictions on the [5R].

After insertion, the optimum step location is regularly updated, until the aircraft is within 20 NM of the step point.
The ND shows symbols for the start of climb (S/C) and the top of climb (T/C). The MCDU shows the associated pseudo-waypoints.
It is possible to convert an optimum step to a geographic step by overwriting the [1L] field (see geographic step).

- **When reaching the step climb pseudo-waypoint (S/C):**
  REQUEST climb clearance to ATC.
  ADJUST the FCU altitude to the STEP ALT, and PUSH the FCU knob.

Note: The step will be deleted from the F-PLN after having sequenced the start of climb for the step.

ENTERING A GEOGRAPHIC STEP (STEP CLIMB OR STEP DESCENT)

WRITE a step altitude and waypoint into the scratchpad.

The format is:
- *Altitude (or FL)/waypoint (Ex: FL 350/BERAD)*
- *Altitude (or FL)/waypoint/distance (Ex: FL 350/BERAD/-20)*

The waypoint must be in the flight plan.

ENTER it in [1L] to [4L] field.

It is possible to independently modify either the location or the altitude of an existing step altitude. It is not possible to modify with a single entry both the location and the altitude : An entry "waypoint/xxx" will be taken by the system as an along track offset of xxx nautical miles.

CHECK the predictions (distance, time).

- **When reaching the step climb or descent pseudo-waypoint (S/C or S/D):**
  REQUEST climb or descent clearance
  ADJUST the FCU altitude to the STEP ALT, and PUSH the FCU knob.

The DIST/TIME field may display the following messages:

- ABOVE MAX if the step altitude exceeds the MAX ALT.
- IGNORED if the step end point is less than 50 NM from the top of descent or if the step climb is located prior to the top of climb or after the top of descent.
- STEP AHEAD when the aircraft is within 20 NM of the step point.
  If the aircraft overflies the step pseudo-waypoint without commencing a climb or a descent, the system deletes the step from the vertical F-PLN automatically (a "STEP DELETED" message is displayed on the MCDU scratchpad), and recomputes the predictions.
  The step is not deleted if the FCU altitude is moved only partially towards the step altitude.
  The flight phase remains "cruise" whenever a step is initiated.

Note: For an altitude restriction defined at a waypoint less than 50 NM before the top of descent and lower than the CRZ FL, it is recommended to enter an altitude constraint rather than a step.

IMMEDIATE CHANGE OF LEVEL IN CRUISE

Ident.: PRO-NOR-SRP-01-50-00003997.0001001 / 14 FEB 11

[3] **Applicable to: MSN 01767-01920, 02108, 02275-02334, 02388, 02457, 02584-02670, 02737-02804, 03750, 04491, 04532, 04645, 05120, 05218, 06720-09063**

When the pilot changes his flight level without inserting a step:

- If the FCU-selected altitude is above the previous CRZ FL, the CRZ FL on the PROG page changes to the new flight level.
- If the FCU-selected altitude is lower than the previous CRZ FL and if the distance to DEST is more than 200 NM, the CRZ FL on the PROG page changes.

  In that case Mach target is managed as follows:
  - At the start of the descent, the Mach target is the managed Mach number at the initial cruise flight level.
  - When the aircraft reaches the new flight level, the Mach target switches either to the Mach number for the lower CRZ FL, or to the speed for the lower CRZ FL if the aircraft reaches the crossover altitude. This logic prevents the aircraft from exceeding VMO during descent.
- If the FCU-selected altitude is lower than the previous CRZ FL and the aircraft is within 200 NM of its destination, the system activates the descent phase.

The pilot may reactivate the cruise phase by entering a new cruise flight level in the PROG page.

IMMEDIATE CHANGE OF LEVEL IN CRUISE

Ident.: PRO-NOR-SRP-01-50-00003997.0002001 / 14 FEB 11

Applicable to: MSN 01957-02097, 02121-02204, 02359, 02405-02443, 02482, 02712, 02908-03618, 03782-04488, 04506-04518, 04535-04637, 04752-05094, 05155-05190, 05230-06336

When the flight crew changes the flight level through a FCU altitude selection:

- If the FCU-selected altitude is above the previous CRZ FL, the CRZ FL on the PROG page changes to the new flight level.
- If the FCU-selected altitude is lower than the previous CRZ FL and if the distance to DEST is more than 200 NM, the CRZ FL on the PROG page changes.

  In that case Mach target is managed as follows:
  - At the start of the descent, the Mach target is the managed Mach number at the initial cruise flight level.
  - When the aircraft reaches the new flight level, the Mach target switches either to the Mach number for the lower CRZ FL, or to the speed for the lower CRZ FL if the aircraft reaches the crossover altitude. This logic prevents the aircraft from exceeding VMO during descent.
- If the FCU-selected altitude is lower than the previous CRZ FL and the aircraft is within 200 NM of its destination, the system activates the descent phase.

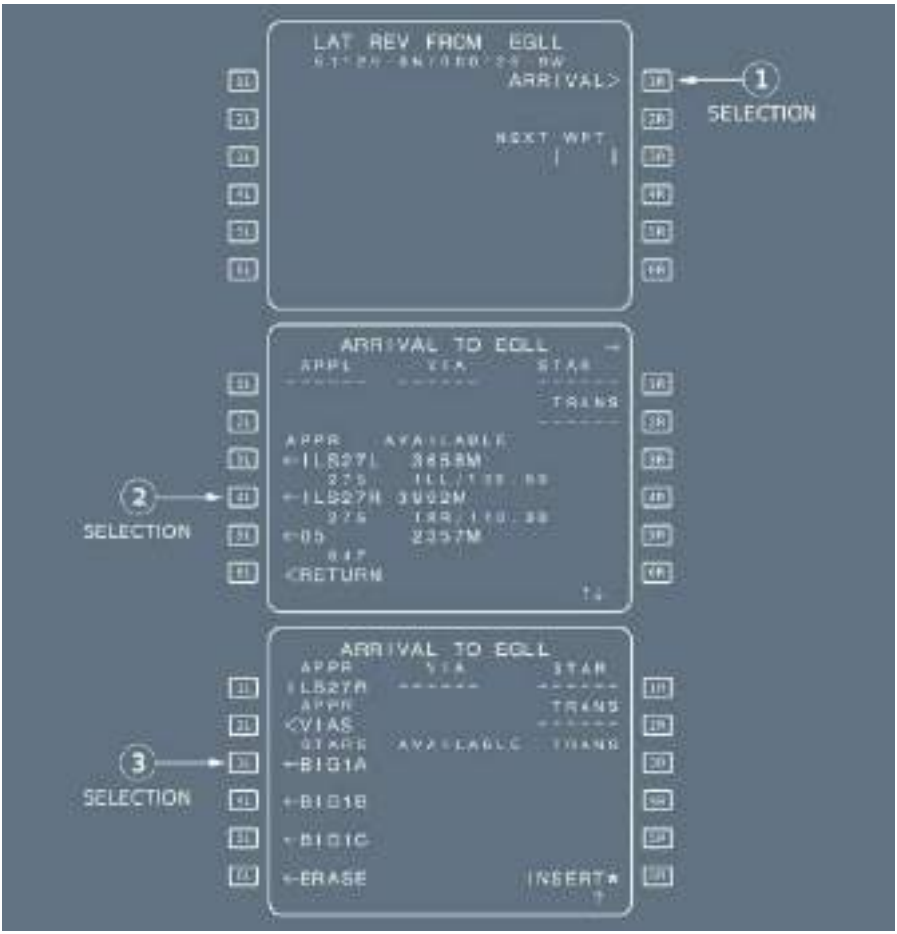
The pilot may reactivate the cruise phase by entering a new cruise flight level in the PROG page.

CAUTION	If the pilot modifies the CRZ FL on the PROG page without setting the FCU altitude, the FMS may target a Speed/Mach above VMO/MMO. Changing the FCU altitude makes the FMS behavior become correct again.

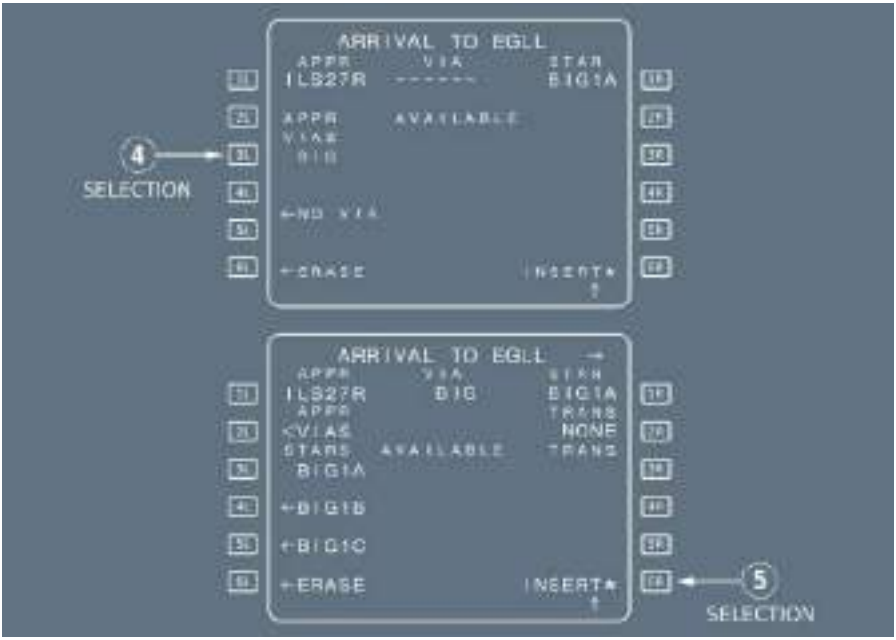
PREPARATION FOR DESCENT AND APPROACH

Ident.: PRO-NOR-SRP-01-50-B-00003998.0001001 / 09 DEC 09
Applicable to: ALL

GENERAL



The preparation for descent and approach consists of :
- Entering PERF and WIND data
- Defining the lateral and vertical F-PLN
- Checking the tuning (auto or manual) of the appropriate navaids

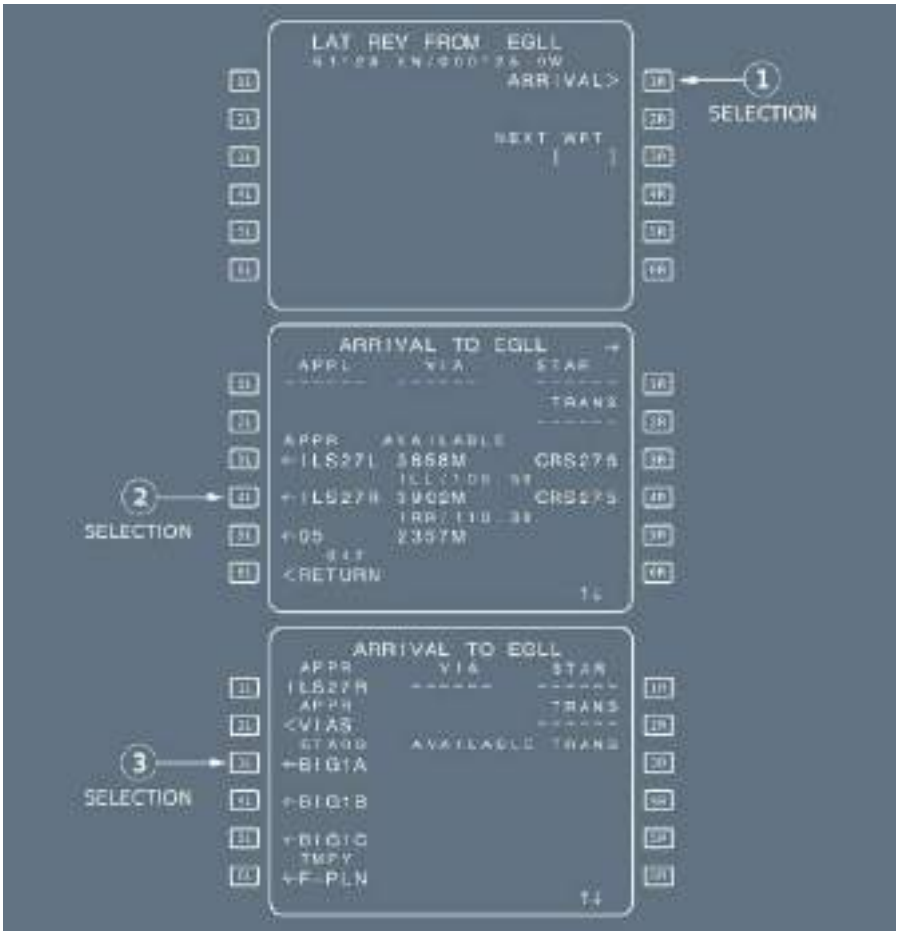


After receiving the arrival information, the flight crew should use the following procedure.

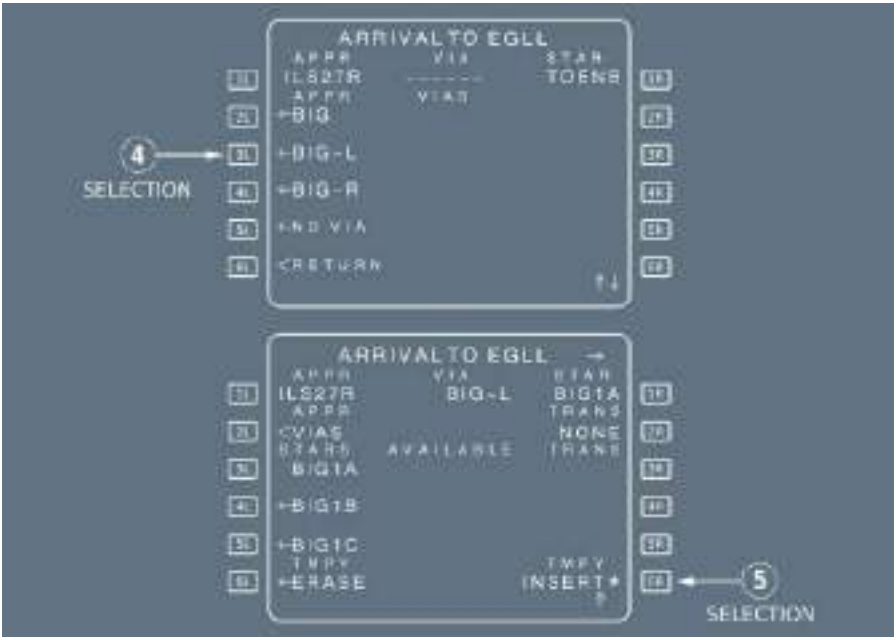
Ident.: PRO-NOR-SRP-01-50-B-00003999.0001001 / 22 MAY 12

4 **Applicable to: MSN 01767-01920, 02108, 02275-02334, 02388, 02457, 02584-02670, 02737-02804, 03750, 04491, 04532, 04645, 05120, 05218, 06720-09063**

REVISION OF LATERAL F-PLN



PERFORM a lateral revision at destination
SELECT an ARRIVAL
SELECT an APPROACH, a STAR, a TRANSITION, a VIA.



When the pilot selects successive items, the page are automatically sequenced. But pressing "NEXT PAGE" key brings up the APPR and STAR page successively.

CHECK the temporary revision including the missed approach.
INSERT the temporary revision, [6R] key.

Ident.: PRO-NOR-SRP-01-50-B-00003999.0015001 / 22 MAY 12
Applicable to: MSN 01957-02097, 02121-02204, 02359, 02405-02443, 02482, 02712, 02908-03618, 03782-04488, 04506-04518, 04535-04637, 04752-05094, 05155-05190, 05230-06336

REVISION OF LATERAL F-PLN

PERFORM a lateral revision at destination
SELECT an ARRIVAL prompt.
SELECT an APPROACH.
SELECT A STAR.
If a desired, call up VIA subpage by pressing [2L] prompt on STAR page and SELECT a VIA.

Note: *When the pilot selects successive items, the page are automatically sequenced. But pressing "→" key brings up the APPR and STAR page successively.*

CHECK and INSERT the TMPY F-PLN or continue with next revision.

Ident.: PRO-NOR-SRP-01-50-B-00004000.0001001 / 22 MAY 12

[5] **Applicable to: MSN 01767-01920, 02108, 02275-02334, 02388, 02457, 02584-02670, 02737-02804, 03750, 04491, 04532, 04645, 05120, 05218, 06720-09063**

REVISION OF VERTICAL FLIGHT PLAN

CHECK that the speed and altitude constraints as displayed on the ND. (Use the CSTR pusbutton).

ENTER any additional speed or altitude constraints using the vertical revision page.

In order not to be too fast when commencing the approach, you may insert a speed constraint at the FAF (Final Approach Fix).

When all computations are completed.

REVIEW the flight plan, using the approach chart.

When the destination runway changes and if the previously selected STAR is compatible with the new runway, the system selects it automatically in the temporary F-PLN. If the flight crew has entered any revision or constraint on this STAR, it will not be transferred.

The pilot must reenter it in order to retain it for this approach.

Ident.: PRO-NOR-SRP-01-50-B-00004000.0003001 / 28 NOV 17
Applicable to: MSN 01957-02097, 02121-02204, 02359, 02405-02443, 02482, 02712, 02908-03618, 03782-04488, 04506-04518, 04535-04637, 04752-05094, 05155-05190, 05230-06336

REVISION OF VERTICAL FLIGHT PLAN

CHECK that the speed and altitude constraints as displayed on the ND. (Use the CSTR pushbutton).
ENTER any additional speed or altitude constraints using the vertical revision page.

In order not to be too fast when commencing the approach, you may insert a speed constraint at the FAF (Final Approach Fix).
When all computations are completed.

REVIEW the flight plan, using the approach chart.

Note: *: When the crew changes the approach or the destination runway, and if the previously selected approach procedure is compatible with the new one, the system automatically inserts it in the temporary F-PLN.*

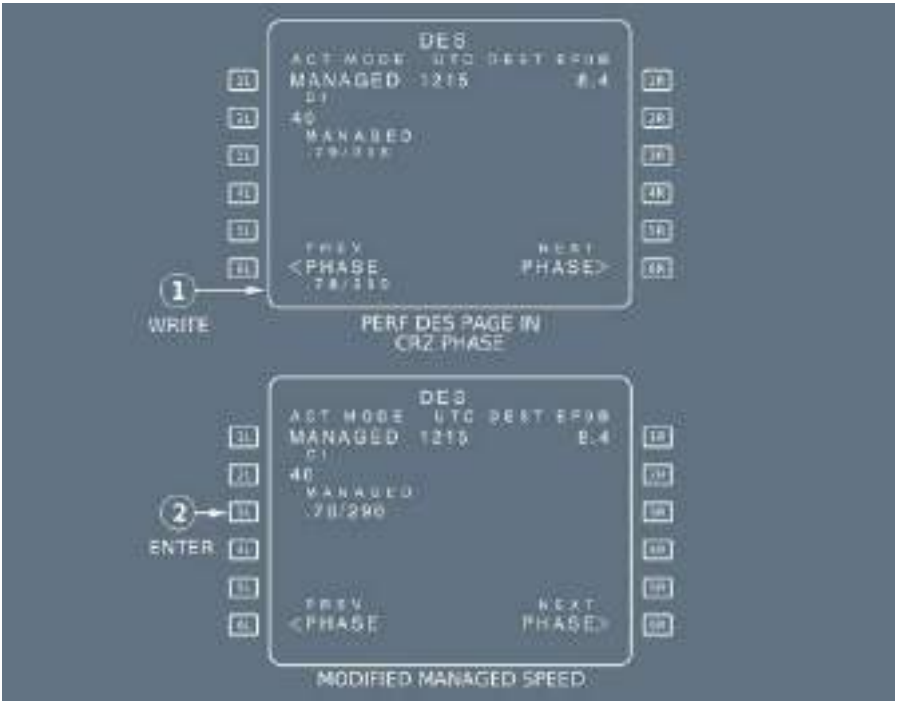
PRESELECTING A MANAGED SPEED/MACH

As long as the descent phase is not active, the PERF DES page may either be used to select a speed, or a Mach number, or both, to replace the optimum descent speed.
The Flight Guidance Computer then uses the entered speed, instead of the optimum speed for computing the descent profile.
When the system switches to the descent phase, it sets the MANAGED target speed to the entered speed. From there, the speed may only be modified by using the FCU selector knob.
Once in descent phase, the pilot cannot modify the MANAGED speed again.

PROCEDURE



PRESS the PERF on MCDU.
SELECT the “NEXT PHASE” prompt.
WRITE the descent speed into the scratchpad and ENTER it.
The 3L field displays the imposed managed speed value.

Ident.: PRO-NOR-SRP-01-50-B-00004002.0009001 / 22 MAY 12

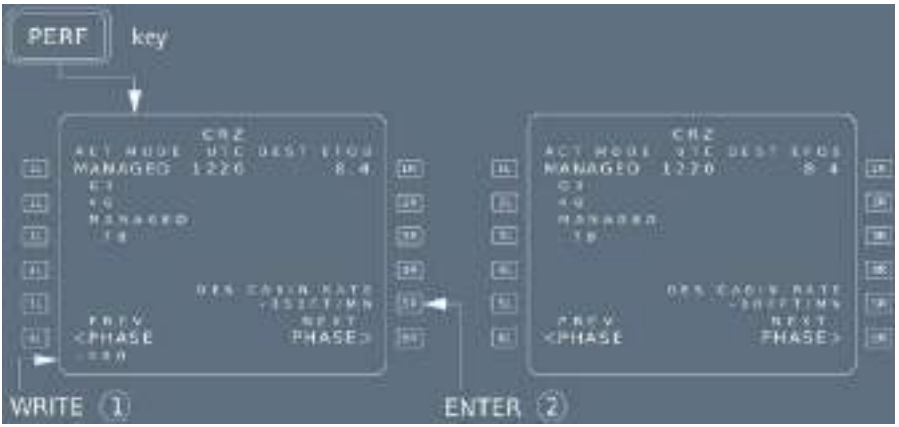
MODIFICATION OF THE CABIN RATE



PROCEDURE

PRESS the MCDU's PERF.
WRITE the new cabin rate in the scratchpad.
ENTER it in the [5R] field.

Ident.: PRO-NOR-SRP-01-50-B-00004004.0002001 / 22 MAY 12
Applicable to: MSN 01767-01920, 02108, 02275-02334

ENTERING THE APPROACH DATA

From PERF DES page, SELECT “NEXT PHASE” [6R] key to display the APPR page.
ENTER QNH, TEMP, WIND at destination (magnetic north reference), DH or MDA (MDH depending on the OPC option).

(The PFD displays the MDA/MDH or DH only when the distance to destination is less than 250 NM).

CHECK and, if necessary, MODIFY
- LDG CONF (landing configuration),
- VAPP (the FM-computed value may be modified),
- TRANS ALT (transition altitude).

The scratchpad displays "ENTER DEST DATA" if the approach page is not completed when the aircraft is 180 NM from destination.

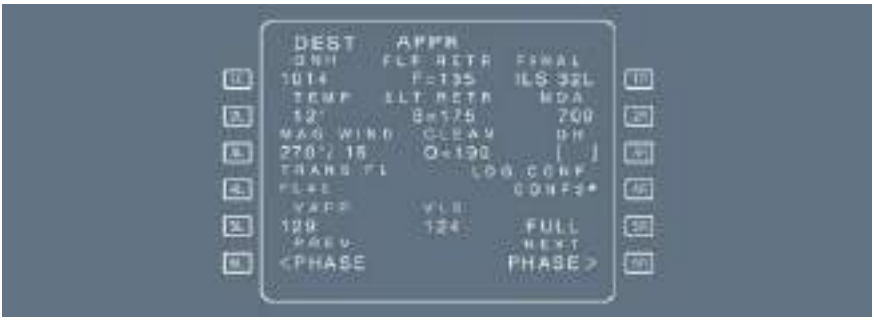
SELECT "NEXT PHASE" in order to display the GO AROUND page.
CHECK and, if necessary, MODIFY the THR RED ALT and the ACC ALT.

Ident.: PRO-NOR-SRP-01-50-B-00004004.0003001 / 19 APR 17
Applicable to: MSN 02195-02204, 02359, 02405, 02482

ENTERING THE APPROACH DATA

From PERF DES page, SELECT "NEXT PHASE" [6R] key to display the APPR page.

ENTER QNH, TEMP, WIND at destination (magnetic north reference), DH or MDA (MDH depending on the OPC option).



(The PFD displays the MDA/MDH or DH value, only when the distance to destination is less than 250 NM).

CHECK and, if necessary, MODIFY the LDG CONF (landing configuration)
CHECK, and if necessary MODIFY the VAPP

The FMS-computed value may be modified

CHECK the TRANS FL value

(see note 1 below)

Note: *1. The default TRANS FL value is computed by the FMS based on:*
- *The Transition Altitude of the destination airport (extracted from the NAV Database),*
- *The QNH value entered on PERF APPR page. Due to the internal FMS computation of altitude constraints, it is rounded to the upper multiple of 5.*
  If this computed TRANS FL value differs by more than 500 ft from the Transition Level specified on the approach chart or reported by ATC, the flight crew may modify the TRANS FL value.

2. The scratchpad displays "ENTER DEST DATA" if the PERF APPR page has not been completed when the aircraft is less than 180 NM from destination.

SELECT "NEXT PHASE" in order to display the GO AROUND page.

CHECK and, if necessary, MODIFY the THR RED ALT and the ACC ALT.

Ident.: PRO-NOR-SRP-01-50-B-00004004.0010001 / 22 MAY 12
9 Applicable to: MSN 02388, 02457, 02584-02670, 02737-02804, 03750, 04491, 04532, 04645, 05120, 05218, 06720-09063

ENTERING THE APPROACH DATA

From PERF DES page, SELECT “NEXT PHASE” [6R] key to display the APPR page.
ENTER QNH, TEMP, WIND at destination (magnetic north reference), minimum in the RADIO or BARO fields.

(The PFD displays the entered BARO or RADIO minimum value, only when the distance to destination is less than 250 NM).

CHECK and, if necessary, MODIFY
- LDG CONF (landing configuration),
- VAPP (the FM-computed value may be modified),
- TRANS ALT (transition altitude).

The scratchpad displays “ENTER DEST DATA” if the approach page is not completed when the aircraft is 180 NM from destination.

SELECT “NEXT PHASE” in order to display the GO AROUND page.
CHECK and, if necessary, MODIFY the THR RED ALT and the ACC ALT.

	V2527-A5/V2527E-A5	40	55

Intentionally left blank

Descent

DESCENT INITIATION

Ident.: PRO-NOR-SRP-01-60-00004007.0001001 / 14 FEB 11
Applicable to: ALL

The top of descent, displayed on the F-PLN page (T/D) and on the ND ( ), is a position that the system calculates, assuming that the aircraft will begin its descent in DES mode with managed speed, and that the system will guide the aircraft along the descent profile computed with all the vertical F-PLN data (ALT CSTR, ECON or AUTO MACH/SPD, SPD CSTR, SPD LIMIT) to reach VAPP at 1 000 ft AGL.

Note: The ND does not display the top of descent when HDG (or TRACK) mode is engaged.

PROCEDURES

- **When the aircraft reaches the top of descent (F/D) :**
  SELECT the altitude target.
  PUSH the ALT selector knob. DES mode engages.
  CHECK the FMA annunciators.

DESCENT MONITORING

Ident.: PRO-NOR-SRP-01-60-A-00004008.0004001 / 06 JUN 16
Applicable to: MSN 01767-01920, 02108, 02275-02334

DES MODE ENGAGED

When DES mode is engaged, NAV mode is engaged, and the system takes into account all altitude and speed constraints of the F-PLN.
The key parameter for monitoring the descent is the vertical deviation (VDEV) displayed on the PFD and on the PROG page, which indicates whether the aircraft is on, above, or below the descent profile.

PROCEDURE

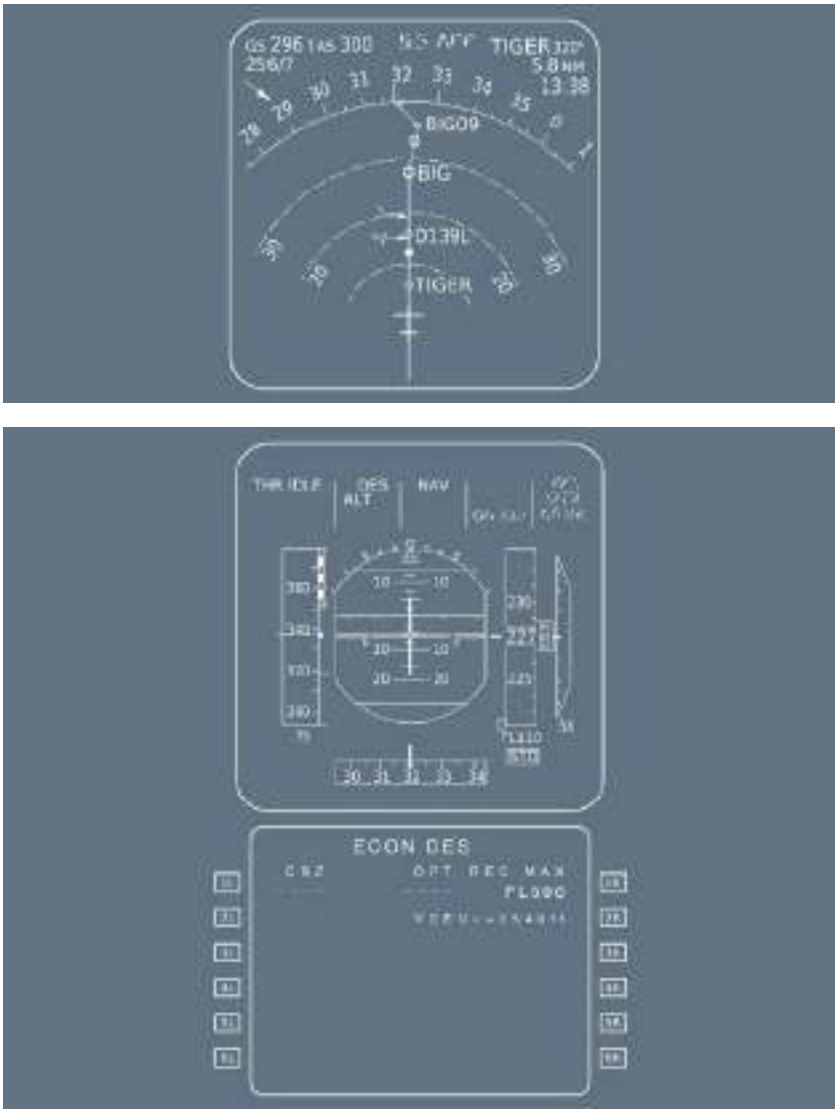
SET the ATC-cleared altitude on the FCU (considering also what is the safe altitude).

If the lowest safe altitude is higher than the ATC-cleared altitude, check with ATC that this constraint applies.
If it is confirmed, SET the FCU altitude to the safe altitude until it is safe to go to the ATC-cleared altitude.

MONITOR the vertical deviation (VDEV) on the PFD and the PROG page.
MONITOR the speed change that occurs, when the aircraft reaches a speed change symbol (magenta ball) under managed speed.

MONITOR the FMA (ALT*, ALT CST*, ALT, ALT CST) when the aircraft reaches level symbols.

■ **If the aircraft is on the descent profile:**
The aircraft is considered to be on the vertical profile, when it is within 50 ft of it. VDEV is close to zero, and the system predicts that it will match constraints until the aircraft levels off at the next FCU altitude.



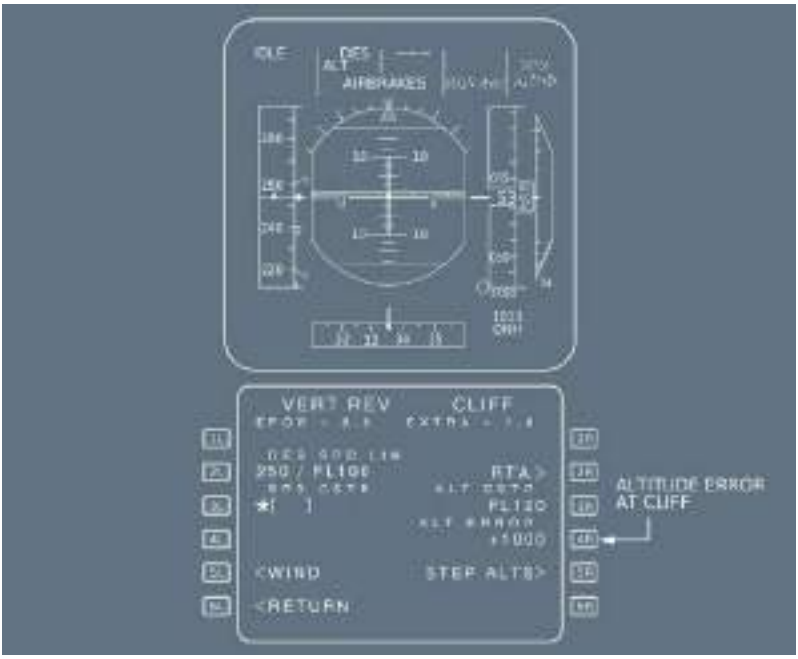
MONITOR the predicted descent point after the next level-off.

The A/THR adjusts the thrust for the particular segment. The first FMA column may display "THR IDLE" or "SPEED".

■ **If the aircraft is above the descent profile:**
VDEV is down on the PFD and positive on the PROG page.

The A/THR sets IDLE thrust and the AP increases speed by calling for down elevator. If the aircraft reaches the upper limit of the managed speed range, the aircraft diverges and maintains the upper limit speed.

Procedure



SELECT a descent speed higher than the upper limit when possible.

MONITOR the intercept symbol .

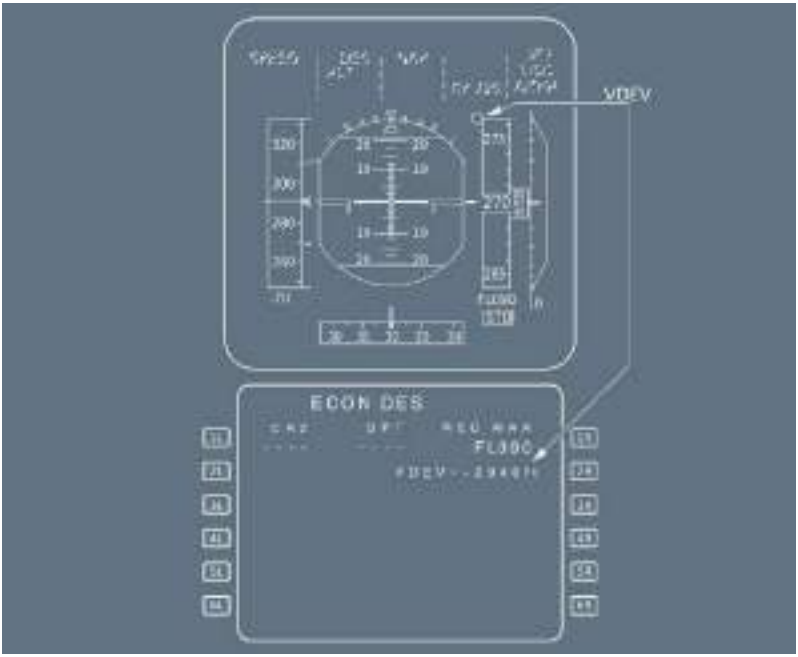
When this symbol reaches the next ALT CSTR waypoint "MORE DRAG" appears on the PFD indicating that speedbrakes must be extended in order to match the next altitude constraint. This is an advisory message.

Note: *With DPO , when above the descent profile, the flight crew may have to extend the speed brakes in order to go back on the descent profile.*

- **If an altitude constraint is predicted to be missed by more than 250 ft,** the vertical revision page shows ALT ERROR at the waypoint.

- **If a speed constraint is predicted to be missed by more than 10 kt:**
  SELECT an appropriate speed.
  RESUME managed speed when the aircraft is back on the descent path.

■ **If the aircraft is below the descent profile:**
VDEV is up on the PFD and negative on the PROG page. The system maintains the target speed (managed or selected speed).



MONITOR the intercept symbol ([ ]) on the ND and any leveling off at the next ALT CSTR.

- **If the aircraft is flying at an altitude that is higher than both the descent speed limit altitude and the destination elevation +5 000 ft:**

  The FMGS maintains the V/S at -1 000 ft/min and the target speed, until the aircraft reaches the altitude constraint or intercepts the descent profile.

- **If the aircraft is flying at an altitude that is lower than either the descent speed limit altitude, or the destination elevation +5 000 ft:**
  The FMGS maintains the V/S at -500 ft/min and the target speed, until the aircraft reaches the altitude constraint or intercepts the descent profile.

- **If the rate of descent has to be increased (ATC requirement):**
  SELECT OP DES mode
  Increase the target speed or extend the speedbrakes.

Ident.: PRO-NOR-SRP-01-60-A-00004008.0005001 / 06 JUN 16
Applicable to: MSN 02195-02204, 02359, 02405, 02482

DES MODE ENGAGED

1 **Applicable to: MSN 02388, 02457, 02584-02670, 02737-02804, 03750, 04491, 04532, 04645, 05120, 05218, 06720-09063**

DES MODE ENGAGED

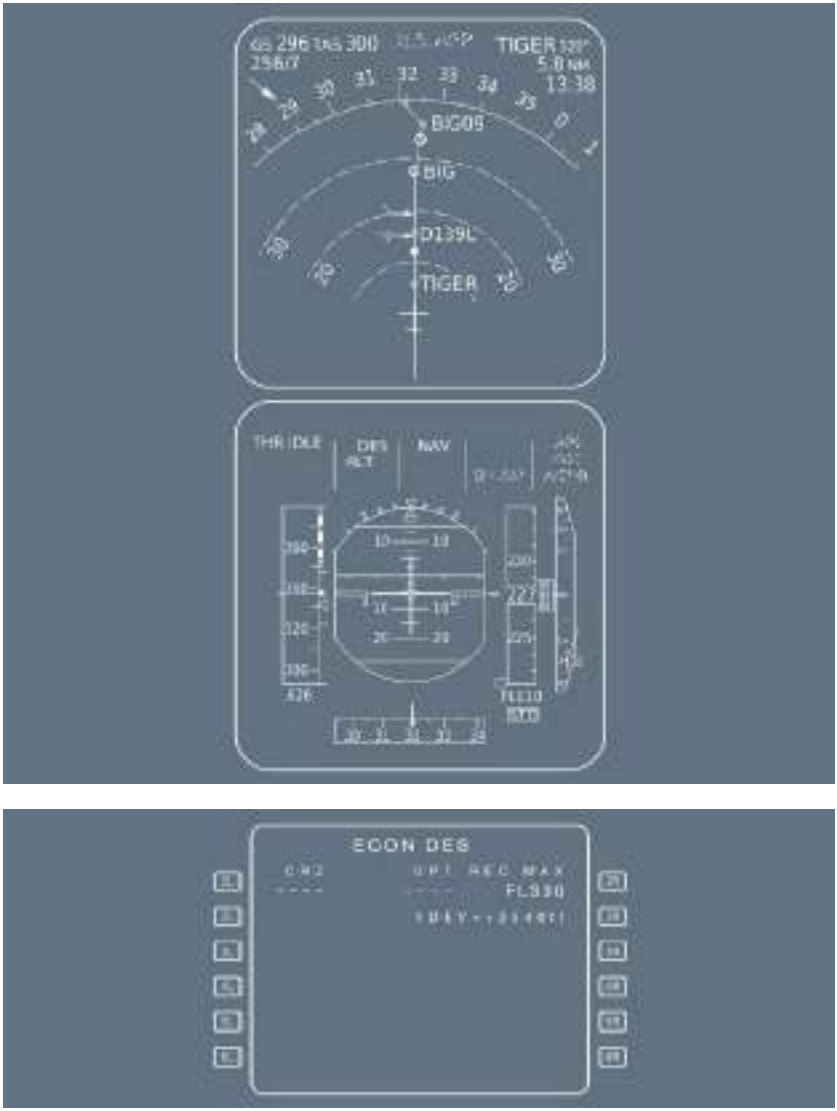
When DES mode is engaged, NAV mode is engaged, and the system takes into account all altitude and speed constraints of the F-PLN.
The key parameter for monitoring the descent is the vertical deviation (VDEV) displayed on the PFD and on the PROG page, which indicates whether the aircraft is on, above, or below the descent profile.

PROCEDURE

SET the ATC-cleared altitude on the FCU (considering also what is the safe altitude).
If the lowest safe altitude is higher than the ATC-cleared altitude, check with ATC that this constraint applies.

If it is confirmed, SET the FCU altitude to the safe altitude until it is safe to go to the ATC-cleared altitude.

MONITOR vertical deviation (VDEV) on the PFD and the PROG page.
MONITOR the speed change that occurs, when the aircraft reaches a speed change symbol (magenta ball) under managed speed.
MONITOR the FMA (ALT*, ALT CST*, ALT, ALT CST), when the aircraft reaches level symbols.



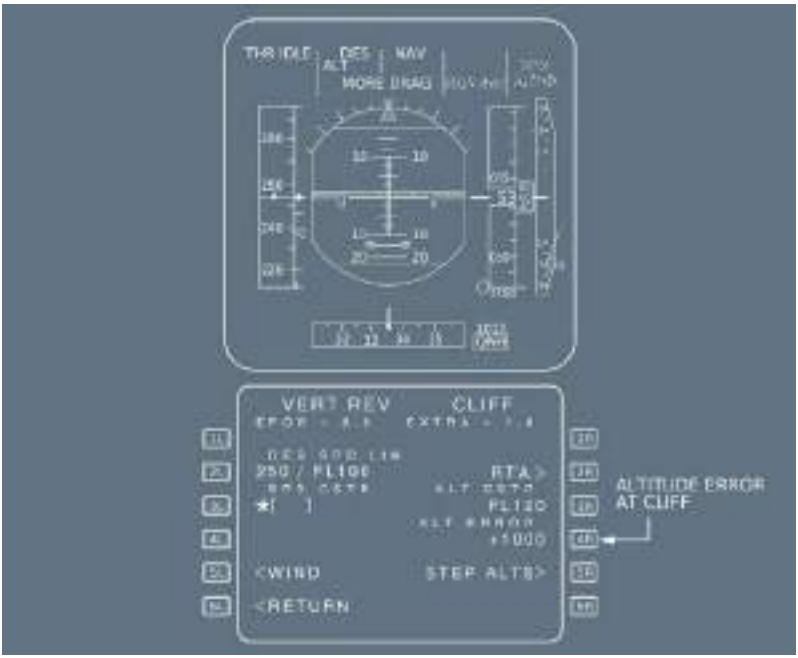
■ **If the aircraft is on the descent profile:**
The aircraft is considered to be on the vertical profile, when it is within 50 ft of it. VDEV is close to zero, and the system predicts that it will match constraints until the aircraft levels off at the next FCU altitude.

MONITOR the predicted descent point after the next level-off.

A/THR adjusts thrust for the particular segment. The first FMA column may display "THR IDLE" or "SPEED".

■ **If the aircraft is above the descent profile:**
VDEV is down on the PFD and positive on the PROG page.
A/THR sets IDLE thrust and the AP increases speed by calling for down elevator. If the aircraft reaches the upper limit of the managed speed range, the aircraft diverges and maintains the upper limit speed.

Procedure



SELECT a descent speed higher than the upper limit when possible.

MONITOR the intercept symbol

When this symbol reaches the next ALT CSTR waypoint, "MORE DRAG" appears on the PFD, indicating that speedbrakes must be extended in order to match the next altitude constraint. This is an advisory message.

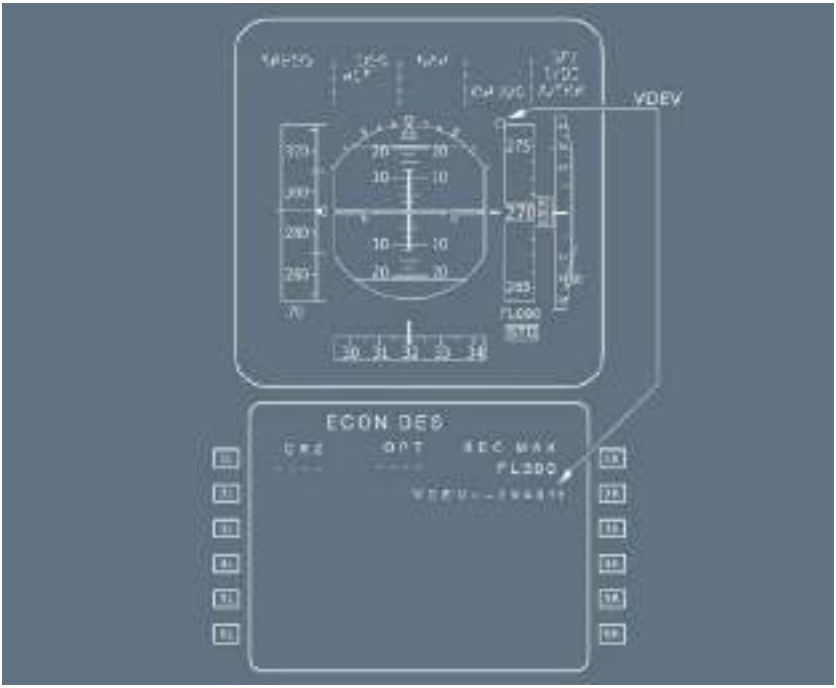
Note: With DPO , when above the descent profile, the flight crew may have to extend the speed brakes in order to go back on the descent profile.

- **If an altitude constraint is predicted to be missed by more than 250 ft,** the vertical revision page shows ALT ERROR at the waypoint.

- **If a speed constraint is predicted to be missed by more than 10 kt:**
  SELECT an appropriate speed.
  RESUME managed speed when the aircraft is back on the descent path.

■ **If the aircraft is below the descent profile:**
VDEV is up on the PFD and negative on the PROG page. The system maintains the target speed (managed or selected speed).

MONITOR the intercept symbol ([ ]) on the ND and any leveling off at the next ALT CSTR.



- **If the aircraft is flying at an altitude that is higher than both the descent speed limit altitude and the destination elevation +5 000 ft:**

  The FMGS maintains the V/S at -1 000 ft/min and the target speed, until the aircraft reaches the altitude constraint or intercepts the descent profile.

- **If the aircraft is flying at an altitude that is lower than either the descent speed limit altitude, or the destination elevation +5 000 ft:**

  The FMGS maintains the V/S at -500 ft/min and the target speed, until the aircraft reaches the altitude constraint or intercepts the descent profile.

- **If the rate of descent has to be increased (ATC requirement):**
  SELECT OP DES mode
  Increase the target speed or extend the speedbrakes.

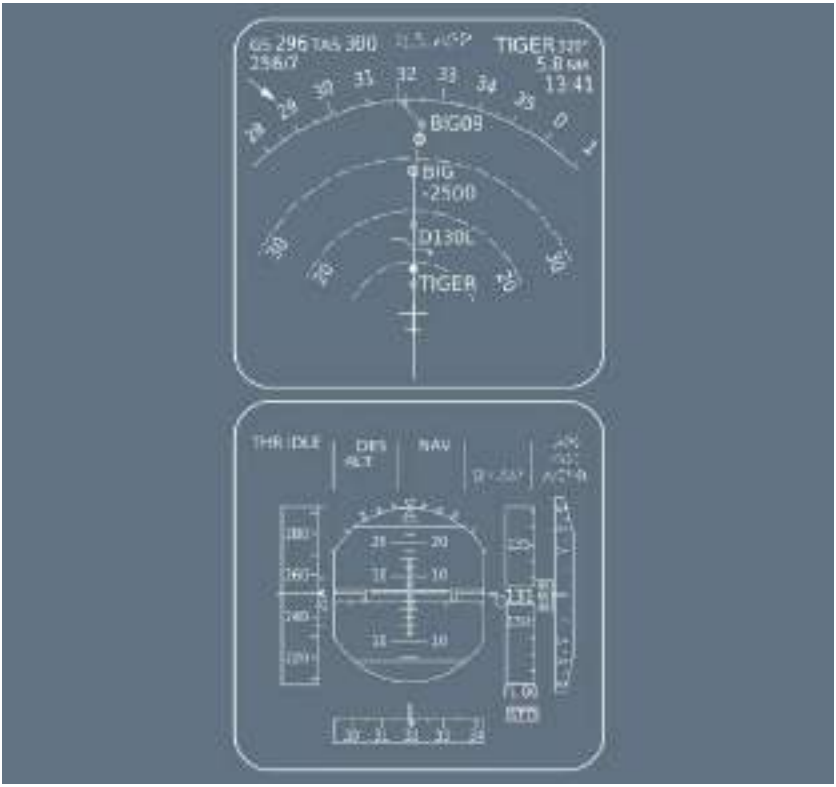
DES MODE ENGAGED

When DES mode is engaged, NAV mode is engaged, and the system takes into account all altitude and speed constraints of the F-PLN.
The key parameter for monitoring the descent is the vertical deviation (VDEV) displayed on the PFD and on the PROG page, which indicates whether the aircraft is on, above, or below the descent profile.

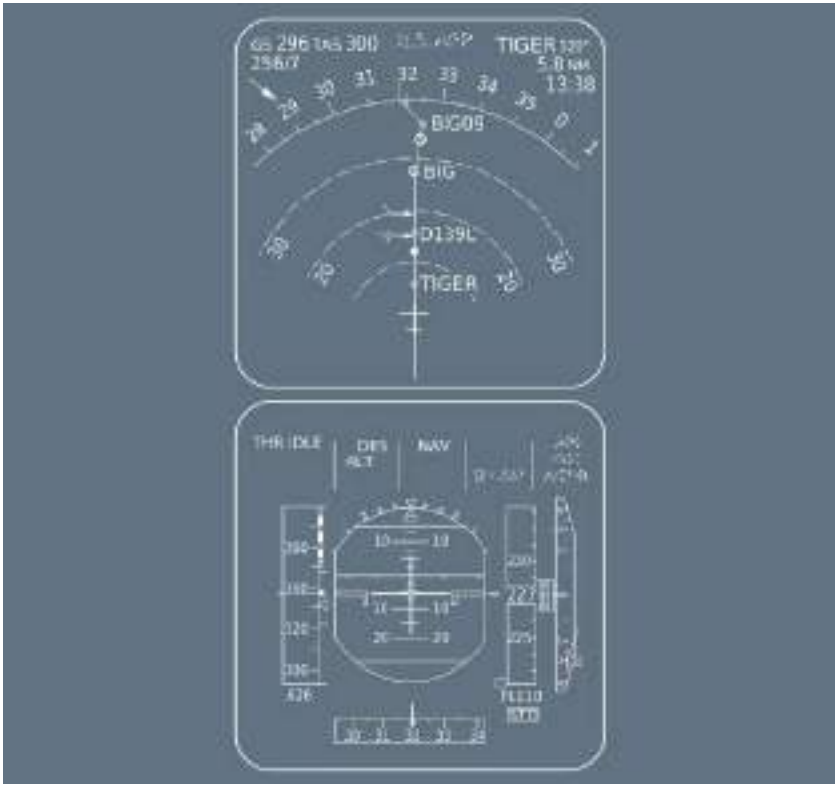
PROCEDURE

SET the ATC-cleared altitude on the FCU (considering also what is the safe altitude).



If the lowest safe altitude is higher than the ATC-cleared altitude, check with ATC that this constraint applies.
If it is confirmed, SET the FCU altitude to the safe altitude until it is safe to go to the ATC-cleared altitude.

MONITOR vertical deviation (VDEV) on the PFD and the PROG page.
MONITOR the speed change that occurs, when the aircraft reaches a speed change symbol (magenta ball) under managed speed.
MONITOR the FMA (ALT*, ALT CST*, ALT, ALT CST), when the aircraft reaches level symbols.



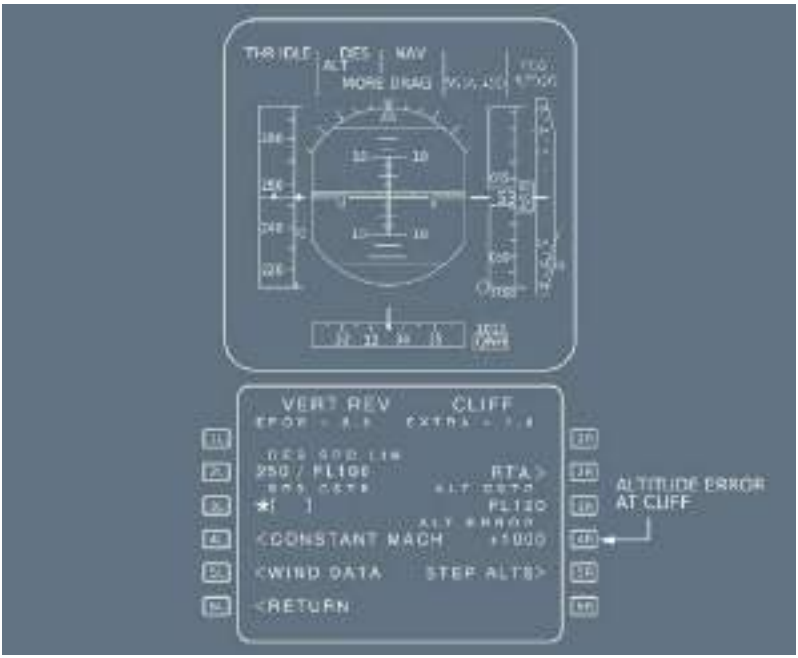
■ **If the aircraft is on the descent profile:**
The aircraft is considered to be on the vertical profile, when it is within 50 ft of it. VDEV is close to zero, and the system predicts that it will match constraints until the aircraft levels off at the next FCU altitude.

MONITOR the predicted descent point after the next level-off.

A/THR adjusts thrust for the particular segment. The first FMA column may display "THR IDLE" or "SPEED".

■ **If the aircraft is above the descent profile:**
VDEV is down on the PFD and positive on the PROG page.
A/THR sets IDLE thrust and the AP increases speed by calling for down elevator. If the aircraft reaches the upper limit of the managed speed range, the aircraft diverges and maintains the upper limit speed.

Procedure



SELECT a descent speed higher than the upper limit when possible.

MONITOR the intercept symbol .

When this symbol reaches the next ALT CSTR waypoint, "MORE DRAG" appears on the PFD, indicating that speedbrakes must be extended in order to match the next altitude constraint. This is an advisory message.

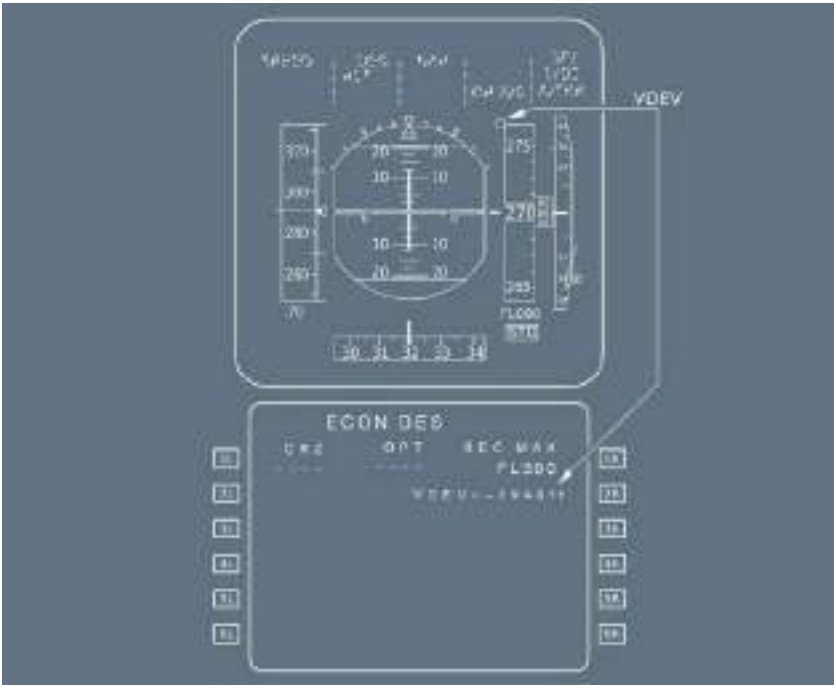
Note: With DPO , when above the descent profile, the flight crew may have to extend the speed brakes in order to go back on the descent profile.

- **If an altitude constraint is predicted to be missed by more than 250 ft** the vertical revision page shows ALT ERROR at the waypoint.

- **If a speed constraint is predicted to be missed by more than 10 kt:**
  SELECT an appropriate speed.
  RESUME managed speed when the aircraft is back on the descent profile.

■ **If the aircraft is below the descent profile**

VDEV is up on the PFD and negative on the PROG page. The system maintains the target speed (managed or selected speed).

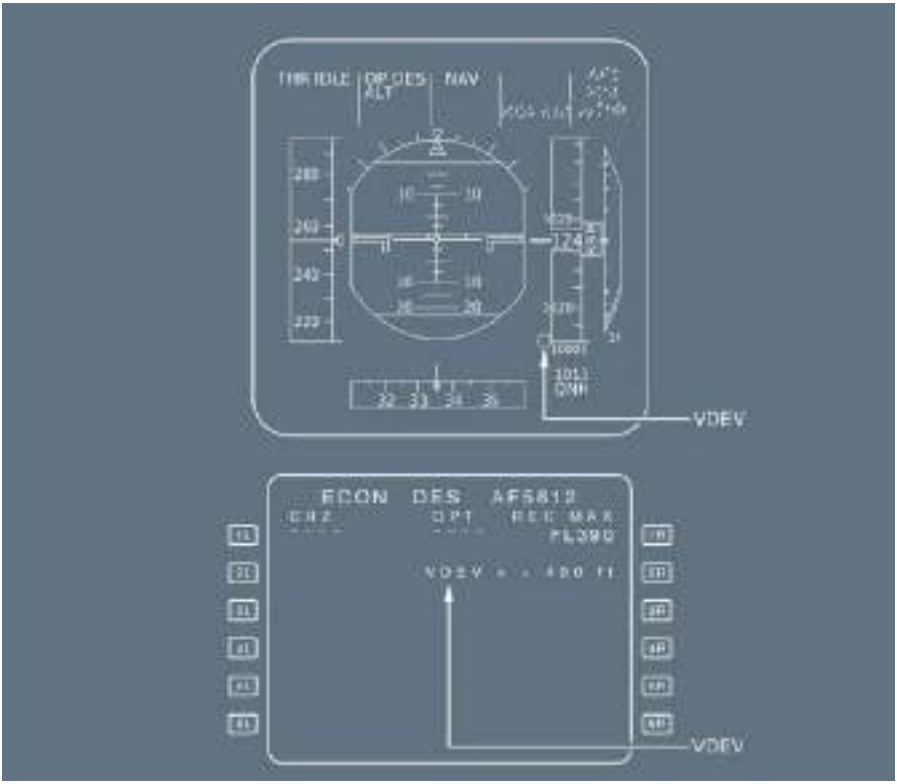


MONITOR the intercept symbol ([]) on the ND and any leveling off at the next ALT CSTR.

- **If the aircraft is flying at an altitude that is higher than both the descent speed limit altitude and the destination elevation +5 000 ft:**

  The FMGS maintains the V/S at -1 000 ft/min and the target speed, until the aircraft reaches the altitude constraint or intercepts the descent profile.

■ **If the aircraft is flying at an altitude that is lower than either the descent speed limit altitude, or the destination elevation +5 000 ft:**
The FMGS maintains the V/S at -500 ft/min and the target speed, until the aircraft intercepts either the altitude constraint or the descent profile.



- **If the rate of descent has to be increased (ATC requirement):**
  SELECT OP DES mode
  Increase the target speed or extend the speedbrakes.

Applicable to: ALL

OP DES, V/S OR FPA MODE ENGAGED

- In either case, the aircraft is no longer guided on the descent profile and altitude constraints are disregarded. If NAV mode is engaged the ND displays a white circle on waypoint with an altitude constraint. If NAV mode is disengaged, the circle is removed.
- The PFD still shows VDEV for reference purposes.
- The target altitude is always the FCU selected altitude (shown in blue).
  On the ND, level-off symbol is blue (no constraint). If NAV mode is engaged and the speed target managed, speed constraints are considered.

When HDG or TRK mode is engaged, vertical position may also be assessed on the ND using the energy circle. It is displayed as a green arc oriented on the current track and centered on the aircraft current position.

Note: *Altitude and speed predictions displayed on the F-PLN page assume an immediate return to DES mode.*

PROCEDURE

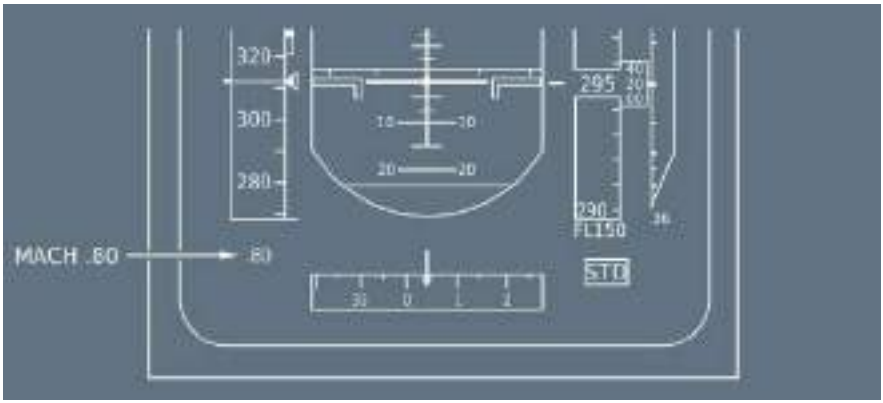
SET the FCU altitude as cleared by ATC, while considering the applicable safe altitude.

If the next safe altitude is higher than the ATC-cleared altitude, check with the ATC to verify that this constraint applies.
If confirmed, set the FCU altitude to the safe altitude, until it is safe to fly at the cleared altitude.

MONITOR the speed target, when the aircraft reaches the speed change symbol.
MONITOR the FMA ALT*, ALT, upon reaching the level symbol.

When in HDG/TRK mode, MONITOR the energy circle ◁✻ on the ND.

The MCDU F-PLN page presents SPD/ALT constraint-matching predictions, which assume that DES mode is immediately re-engaged.



CHECK the predictions before re-engaging DES mode (in order to resume the descent profile).

Note: *VDEV is available on the PFD even in HDG mode; it is a valuable tool for monitoring the descent, as long as crosstrack error (XTK) is less than 5 NM.*
The aircraft automatically decelerates for approach, only if it flies over the DECEL pseudo waypoint with NAV mode engaged (or LOC, LOC).*

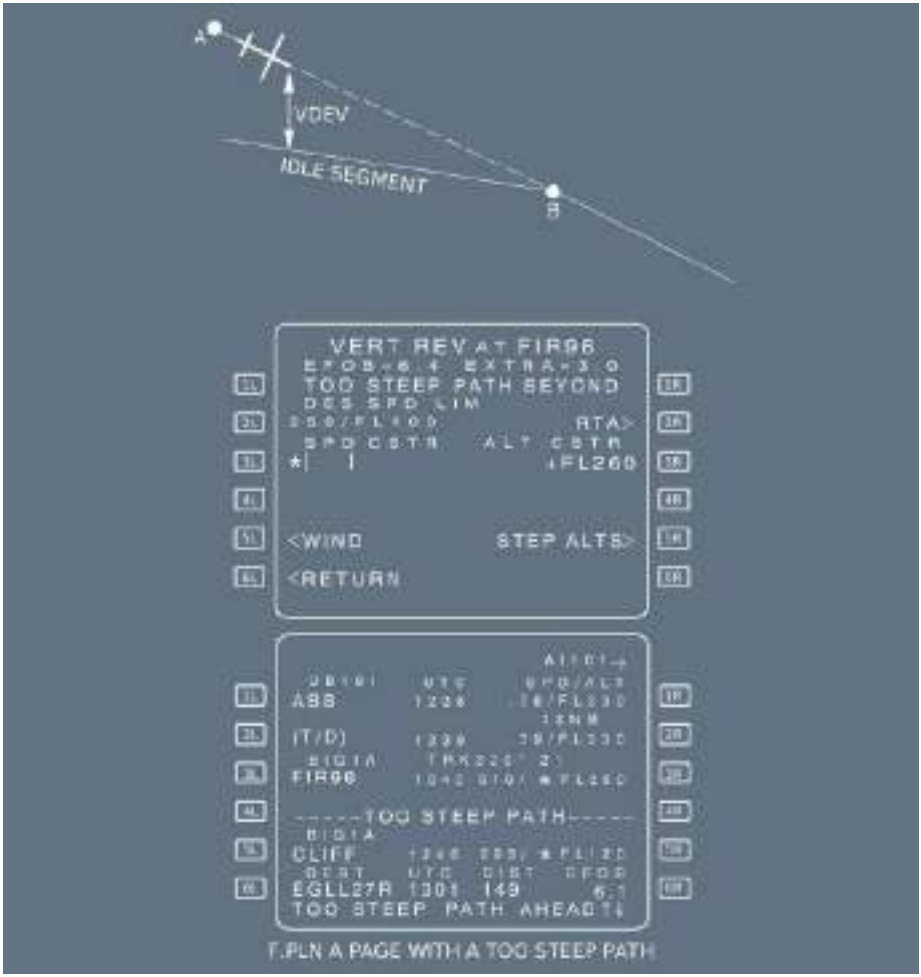
EXPEDITE DESCENT (IF INSTALLED)

Ident.: PRO-NOR-SRP-01-60-00004010.0001001 / 22 MAY 12
Applicable to: ALL

- **When ATC requires a rapid descent:**
  DEPRESS THE EXPED pushbutton
  Flight guidance (FG) pitches the aircraft to acquire and maintain 0.80/340. FG orders a pitch rate that produces no more than 0.15 g. The pilot can use this mode to initiate an emergency descent. To resume normal descent, PUSH the ALT selection knob or engage any other vertical mode.

MONITORING THE NAVIGATION IN THE TERMINAL CONTROL AREA

Ident.: PRO-NOR-SRP-01-60-00004012.0002001 / 14 FEB 11
Applicable to: ALL



If the MCDU “AREA RNP IS XX.X” message or “PROCEDURE RNP IS XX.X” message is displayed, the pilot will manually-entered RNP value in the REQUIRED field of the PROG page and clear or modify it, if it is not in accordance with the RNP value specified in the area (NAV or approach chart).

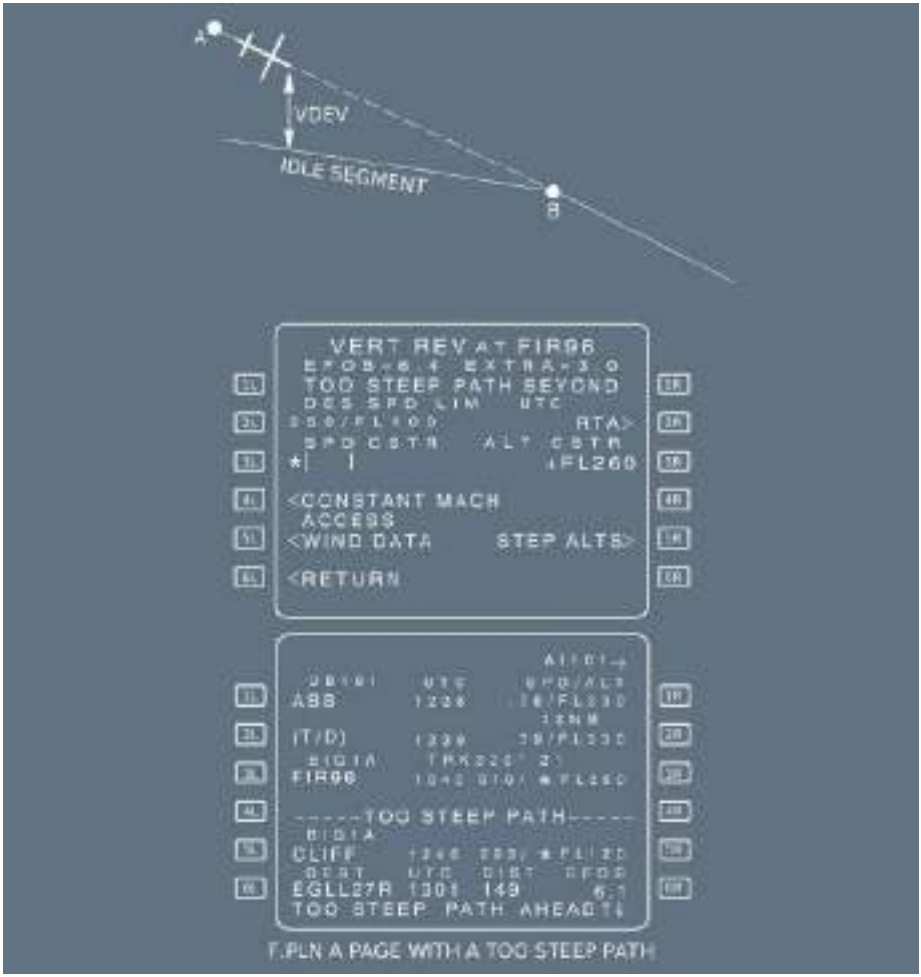
TOO STEEP PATH

Ident.: PRO-NOR-SRP-01-60-00004013.0007001 / 22 MAY 12

2 **Applicable to: MSN 01767-01920, 02108, 02275-02334, 02388, 02457, 02584-02670, 02737-02804, 03750, 04491, 04532, 04645, 05120, 05218, 06720-09063**

“TOO STEEP PATH AHEAD” appears on the MCDU scratchpad, when the system predicts this situation, and TOO STEEP PATH is displayed on the F-PLN page.
When the aircraft is crossing the first waypoint of a TOO STEEP PATH, the system computes a flyable descent profile (with an idle segment). The VDEV makes a jump because it is related to a new profile.

F-PLN A PAGE WITH A TOO STEEP PATH



PROCEDURE

- **When passing the first waypoint of the TOO STEEP PATH:**
  MONITOR VDEV and predictions at the next CSTR waypoint.
  If required, EXTEND the speedbrakes before seeing the “MORE DRAG” message.
  CONSIDER using a holding pattern, if necessary.

TOO STEEP PATH

Ident.: PRO-NOR-SRP-01-60-00004013.0008001 / 22 MAY 12
Applicable to: MSN 01957-02097, 02121-02204, 02359, 02405-02443, 02482, 02712, 02908-03618, 03782-04488, 04506-04518, 04535-04637, 04752-05094, 05155-05190, 05230-06336

"TOO STEEP PATH AHEAD" appears on the MCDU scratchpad, when the system predicts this situation, and TOO STEEP PATH is displayed on the F-PLN page.
When the aircraft is crossing the first waypoint of a TOO STEEP PATH, the system computes a flyable descent profile (with an idle segment). The VDEV makes a jump because it is related to a new profile.

F-PLN A PAGE WITH A TOO STEEP PATH

PROCEDURE

- **When passing the first waypoint of the TOO STEEP PATH:**
  MONITOR VDEV and predictions at the next CSTR waypoint.
  If required, EXTEND the speedbrakes before seeing the “MORE DRAG” message.
  CONSIDER using a holding pattern, if necessary.

HOLDING PATTERN

Ident.: PRO-NOR-SRP-01-60-00004014.0001001 / 09 OCT 12
Applicable to: ALL

A hold may be required during the descent, and may be manually inserted.

PROCEDURE

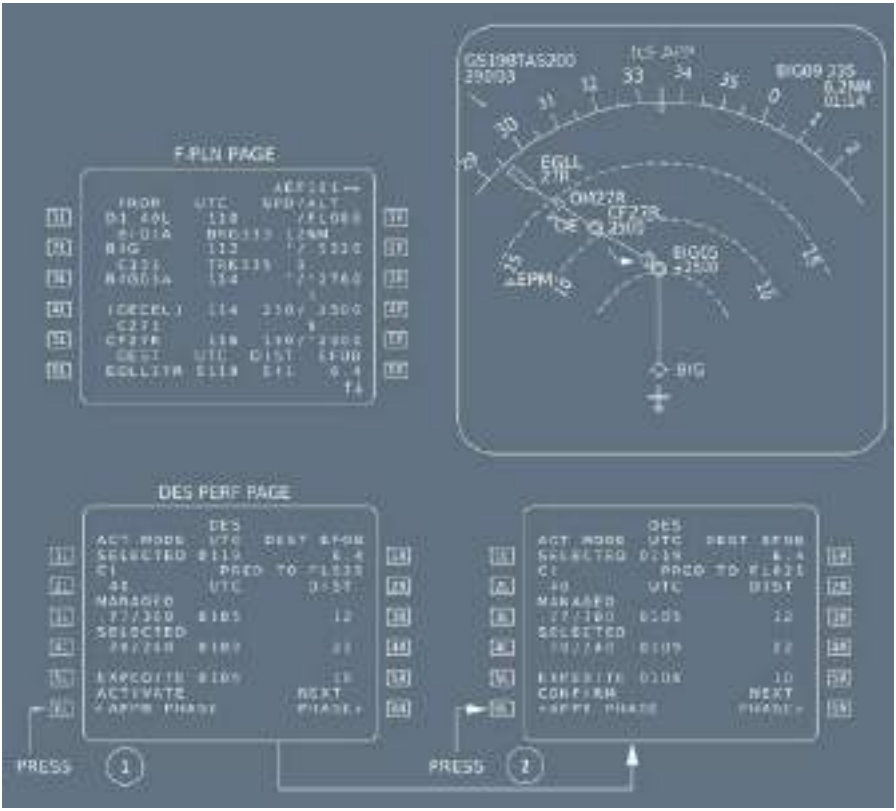
PRESS the F-PLN key.
SELECT the lateral revision page.
SELECT the HOLD prompt.
CHECK the HOLDING data, and MODIFY it if necessary.
CHECK the temporary flight plan and INSERT the holding pattern in it.

Note: If the holding fix is close to the DECEL pseudo waypoint and the speed is managed, manually activate the approach phase to change the managed target speed to approach speed (VAPP). This will avoid having an increase of speed not appropriate.

MANUAL TERMINATION

Ident.: PRO-NOR-SRP-01-60-00004016.0001001 / 09 DEC 09
Applicable to: ALL

You should not use DES mode when entering a leg with manual termination. Manual termination, which is defined as a track or a heading with no termination, is always part of a database procedure. The computed descent flight profile may not be adequate when flying this type of leg.

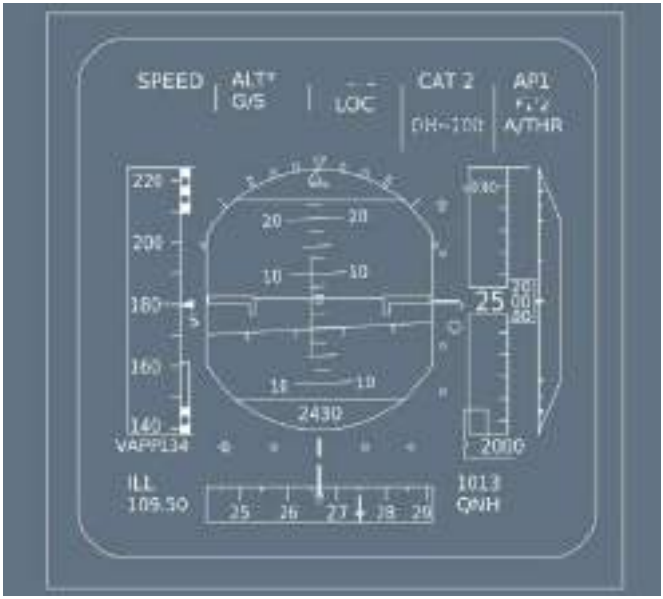


Approach

INITIAL APPROACH

Ident.: PRO-NOR-SRP-01-70-00004017.0002001 / 17 MAR 11
Applicable to: ALL

UPON REACHING THE INITIAL APPROACH AREA



- Approach phase will activate automatically when flying over the DECEL pseudo waypoint with NAV, APPR NAV or LOC* or LOC mode engaged.
- You will activate manually the approach phase on the PERF page if:
  - HDG or TRK mode is engaged, or
  - You are flying a go around, or
  - An early deceleration is required

MANAGED SPEED

CHECK that managed speed is active: MONITOR the target speed.

During the approach, the autothrust limits the speed of the current configuration. (GD, S, F, VAPP).

- **If ATC requires a specific speed:**
  SWITCH to selected speed (turn and pull the speed selector knob on the FCU).
  ADJUST the aircraft configuration accordingly.
- **If ATC orders successive step descents down to the final approach flight path:**
  Use the V/S or FPA mode.
  MONITOR VDEV.

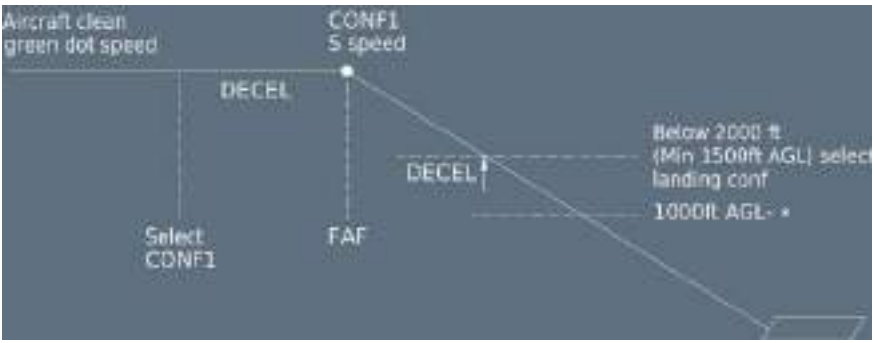
NAV ACCURACY

As required by the SOP.
Without installed GPS and when no DME is available for the accuracy check, use HIGH/LOW on the PROG page.
In this case, consider a “HIGH” to be equivalent to a positive crosscheck.

ATC CLEARANCE

MODIFY the F-PLN, RAD NAV, and PERF APPR data to agree with the latest clearance and landing information.

ILS/MLS/GLS/FLS APPROACH



Ident.: PRO-NOR-SRP-01-70-A-00004018.0001001 / 17 MAR 11
Applicable to: ALL

INTERMEDIATE/FINAL APPROACH (ILS APPROACH ENTERED IN THE F-PLN)

The preferred technique for flying an ILS approach is to fly a decelerated approach using the AP/FDs, the LOC and G/S modes, A/THR in the SPEED mode, managed speed target is recommended.

DECELERATED APPROACH

The decelerated approach technique brings the aircraft down to 1 000 ft, at VAPP. In most cases, the interception of the final descent path is achieved with CONF 1 at S speed.

(*) The approach must be stabilized at approach speed (minimum ground speed) in the landing configuration before reaching 1 000 ft AGL.

Ident.: PRO-NOR-SRP-01-70-A-00004019.0008001 / 17 MAR 11
Applicable to: MSN 01767-01920, 02108, 02195-02359, 02405, 02482

APPROACH MODE ACTIVATION (LOC-G/S)

- **When cleared by ATC and when appropriate:**
  DEPRESS the APPR pushbutton to arm the APPR mode for the approach entered in the flight plan.

  Note: If a NON PRECISION approach is selected in the active flight plan and if the flight crew manually tunes an ILS on the RAD NAV page, the MCDU displays "CHECK APPR SELECTION" and the PFD displays "CHECK APP GUIDANCE" or "CHECK APP SEL" (if CPIP3 installed). These messages are a reminder to the flight crew that, although an ILS is tuned on RAD NAV page, the available approach guidance modes are APP NAV-FINAL when the APPR pushbutton is pressed in on the FCU.

The FCU APPR pushbutton arms or engages LOC and G/S modes, if:
- An ILS approach is entered in the flight plan, or
- No approach, or only a runway, is entered in the flight plan, and an ILS is manually-tuned on the RAD NAV page, or
- Both RMPs are set to NAV, and an ILS is selected.

Ident.: PRO-NOR-SRP-01-70-A-00004019.0009001 / 17 MAR 11

1 **Applicable to: MSN 01957-02097, 02121-02139, 02388, 02443-02457, 02584-09063**

APPROACH MODE ACTIVATION (LOC-G/S)

- **When cleared by ATC and when appropriate:**
  DEPRESS the APPR pushbutton to arm the APPR mode for the approach entered in the flight plan.

  Note: *If a NON PRECISION approach is selected in the active flight plan and if the flight crew manually tunes an ILS on the RAD NAV page, the MCDU and the PFD display "CHECK APPR SELECTION". This message is a reminder to the flight crew that, although an ILS is tuned on RAD NAV page, the available approach guidance modes are APP NAV-FINAL when the APPR pushbutton is pressed in on the FCU.*

  The FCU APPR pushbutton arms or engages LOC and G/S modes, if:
  - An ILS approach is entered in the flight plan, or
  - No approach, or only a runway, is entered in the flight plan, and an ILS is manually-tuned on the RAD NAV page, or
  - Both RMPs are set to NAV, and an ILS is selected.

Ident.: PRO-NOR-SRP-01-70-A-00004020.0002001 / 17 MAR 11

2 **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

AUTOLAND

CHECK that the FMA displays the aircraft capability (CAT 2 or CAT 3) for the intended ILS approach.
MONITOR the radio automatic callout.

- **At 350 ft RA:**
  CHECK that “LAND” is displayed on the FMA.
  CHECK ILS course.
  If LAND is not displayed or if the ILS course is not correct, do not perform an autoland. The flight crew should perform a go-around, if visual references are not sufficient.

- **Between 50 and 40 ft RA:**
  CHECK that “FLARE” is displayed on the FMA.

- **At approximately 30 ft RA:**
  CHECK that "IDLE" is displayed on the FMA, and that autothrust starts to reduce thrust toward IDLE.

- **At 10 ft, "RETARD" callout comes up:**
  MOVE the thrust levers to IDLE.
  Autothrust disconnects.

- **At touchdown:**
  CHECK that "ROLL OUT" appears on the FMA.

  Note: *In the case of tailwind during an automatic rollout, it is recommended to use manual braking without delay or automatic braking for an optimised runway centerline tracking.*

- **At the end of the Rollout:**
  Disconnect the autopilot.

  If the flight crew does not disconnect the AP at the end of the rollout, and uses the nosewheel steering handwheel to taxi the aircraft off the runway, the following will occur:
  - *The AP will try to steer the aircraft back to the runway centerline, if the nosewheel steering handwheel is released and the aircraft heading is less than 20 ° off the runway centerline.*
  - *The AP will automatically disconnect, if the aircraft heading is 20 ° or more off the runway centerline.*

Ident.: PRO-NOR-SRP-01-70-A-00004020.0012001 / 17 MAR 11

3 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

AUTOLAND

CHECK that the FMA displays the aircraft capability (CAT 2 or CAT 3) for the intended ILS approach.
MONITOR the radio automatic callout.

- **At 350 ft RA:**
  CHECK that "LAND" is displayed on the FMA.
  CHECK ILS course.
  If LAND is not displayed or if the ILS course is not correct, do not perform an autoland. The flight crew should perform a go-around, if visual references are not sufficient.

- **Between 50 and 40 ft RA:**
  CHECK that "FLARE" is displayed on the FMA.

- **At approximately 30 ft RA:**
  CHECK that "IDLE" is displayed on the FMA, and that autothrust starts to reduce thrust toward IDLE.

- **At 10 ft, "RETARD" callout comes up:**
  MOVE the thrust levers to IDLE.
  Autothrust disconnects.

- **At touchdown:**
  CHECK that "ROLL OUT" appears on the FMA.

- **At the end of the Rollout:**
  Disconnect the autopilot.

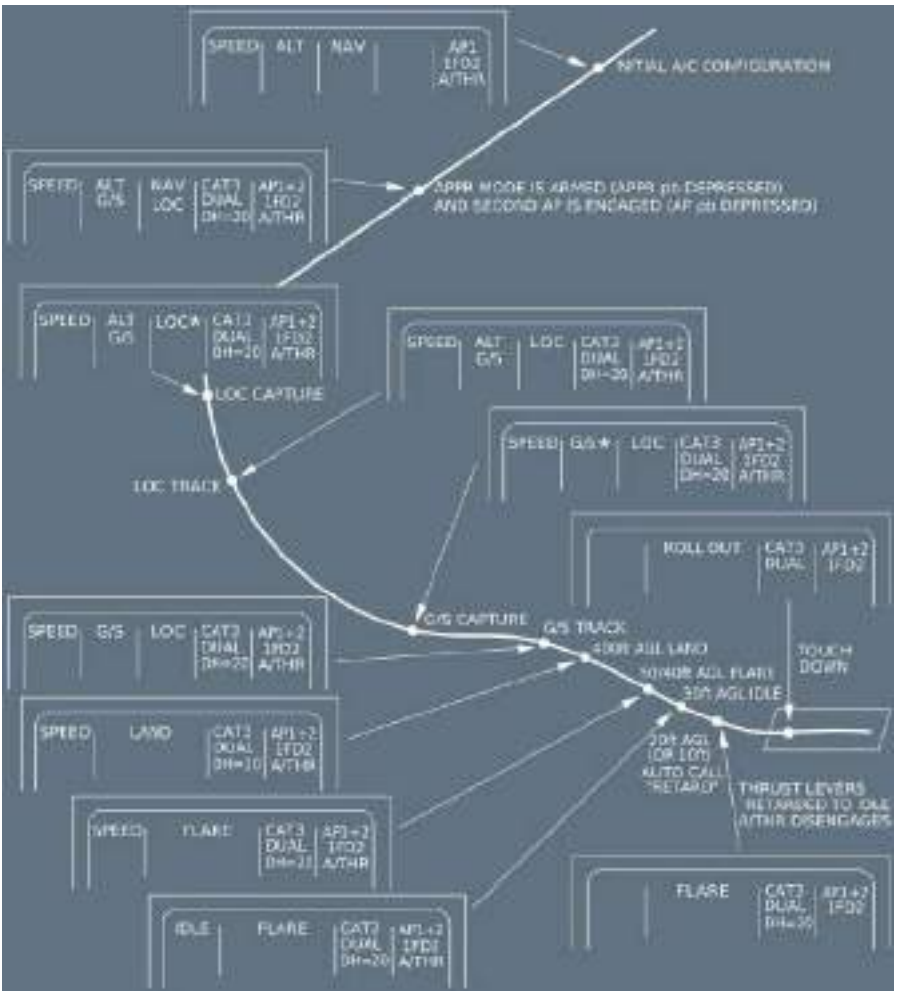
  If the flight crew does not disconnect the AP at the end of the rollout, and uses the nosewheel steering handwheel to taxi the aircraft off the runway, the following will occur:
  - *The AP will try to steer the aircraft back to the runway centerline, if the nosewheel steering handwheel is released and the aircraft heading is less than 20 ° off the runway centerline.*
  - *The AP will automatically disconnect, if the aircraft heading is 20 ° or more off the runway centerline.*

Ident.: PRO-NOR-SRP-01-70-A-00004021.0001001 / 17 MAR 11
Applicable to: ALL

MANUAL LANDING

- **At DH:**
  DISCONNECT the APs. SPEED mode remains engaged.

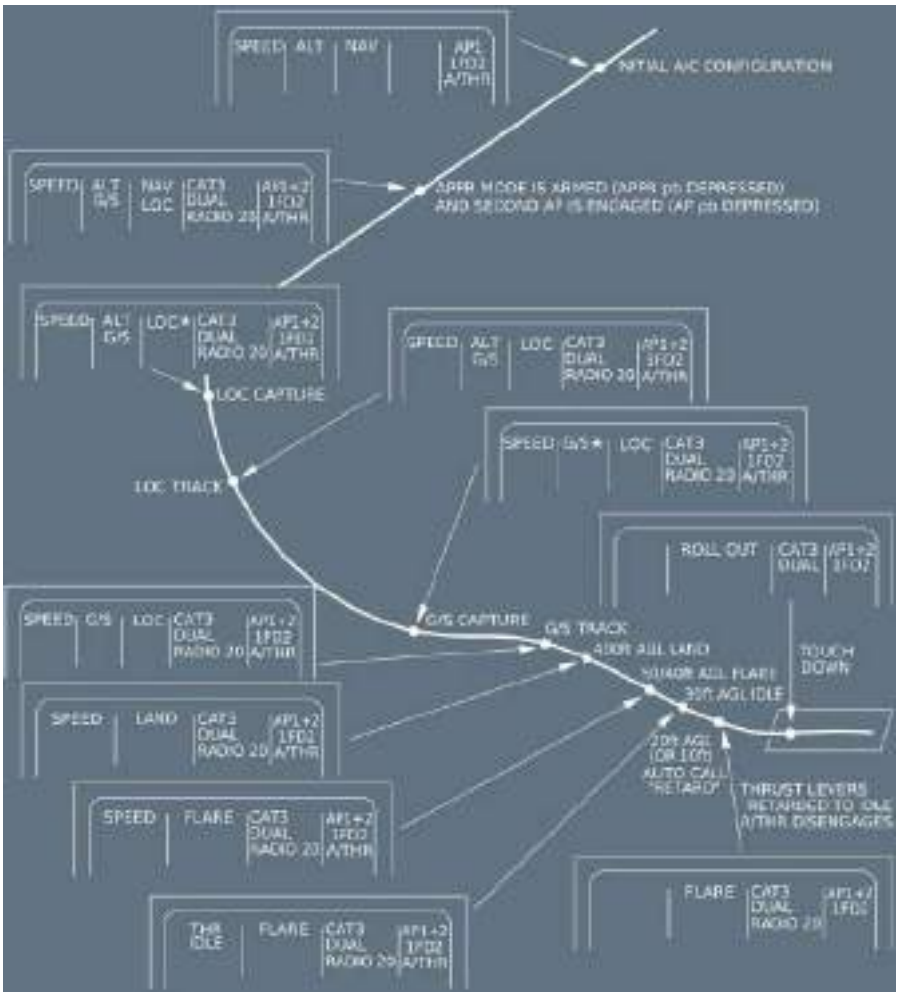
- **At 20 ft "RETARD" automatic call out comes up:**
  MOVE the thrust levers to IDLE if they are not there already. (The A/THR disconnects).



- **At touch down:**

  "ROLL OUT" appears on the FMA and the yaw bar comes up on the PFD.

  Note: *The retard call out is only a reminder when a manual landing is performed.*



Ident.: PRO-NOR-SRP-01-70-A-00004022.0004001 / 22 MAY 12
Applicable to: MSN 01767-01920, 02108, 02195-02359, 02405, 02482

STANDARD ILS AUTOMATIC APPROACH

4 **Applicable to: MSN 01957-02097, 02121-02139, 02388, 02443-02457, 02584-09063**

STANDARD ILS AUTOMATIC APPROACH

Ident.: PRO-NOR-SRP-01-70-A-00004023.0001001 / 26 NOV 13
Applicable to: ALL

EARLY SELECTION OF APPROACH MODE LOC-G/S

Pressing the APPR pushbutton arms LOC and G/S.
When the aircraft is above 5 000 ft AGL, the Radio altimeter signals may not be valid. As long as the Radio altimeter signals are invalid, the FMA displays CAT 1.

- **When the aircraft is cleared for an ILS/MLS ◁ /GLS ◁ approach:**
  PRESS the APPR pb on the FCU.
- **When the aircraft is below 5 000 ft AGL:**
  Check that the FMA displays the correct capability for the intended approach.

Ident.: PRO-NOR-SRP-01-70-A-00004024.0002001 / 29 MAY 13
Applicable to: ALL

GLIDESLOPE INTERCEPTION FROM ABOVE

If the aircraft is above the glideslope, the system will not capture the G/S automatically.
The pilot must bring the aircraft onto the glideslope beam, and select an appropriate V/S to intercept it. *Refer to PRO-NOR-SOP-18-C Approach using LOC G/S Guidance - General*.

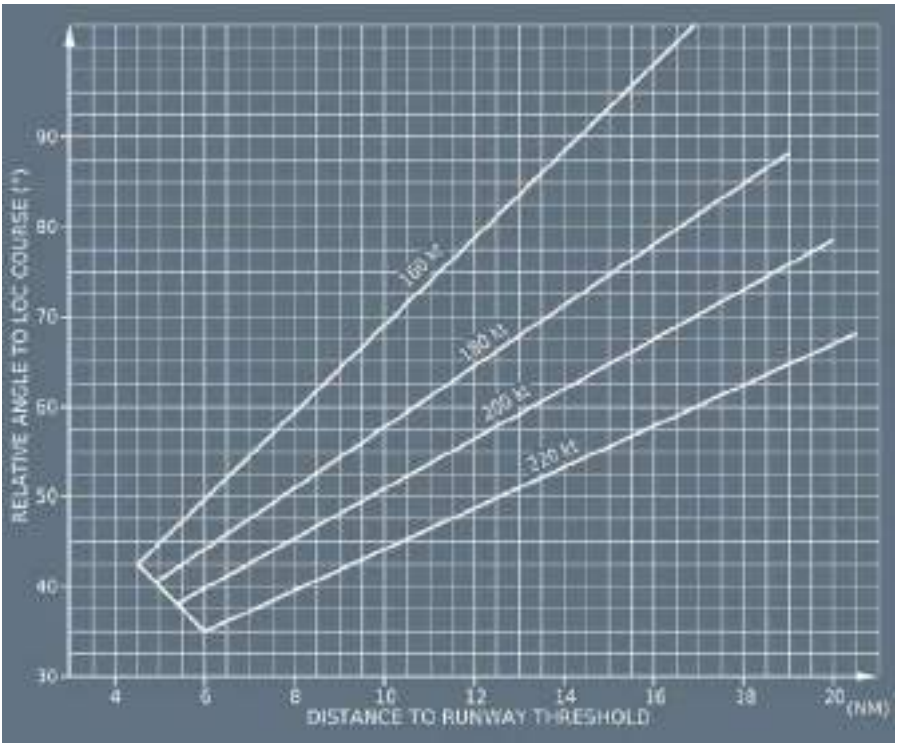
Ident.: PRO-NOR-SRP-01-70-A-00004025.0001001 / 17 MAR 11
Applicable to: ALL

DATA LOCK

When the aircraft reaches 700 ft RA with APPR mode (LOC and G/S) armed or engaged, the ILS FREQ and course are frozen in the receiver.
This function (ILS tune inhibit) is available, when at least one AP/FD is engaged. Any attempt to change the ILS frequency or CRS, via the MCDU or RMP, does not affect the receiver.
If the speed is managed, the system does not accept any modifications the pilot may enter on the PERF APPR page (surface wind, selected landing configuration, or VAPP) for speed guidance purposes below this altitude.
When the aircraft reaches 400 ft RA, LAND mode engages. The flight crew can only disengage this mode by engaging the GO AROUND mode.

Ident.: PRO-NOR-SRP-01-70-A-00004026.0001001 / 17 MAR 11
Applicable to: ALL

USE OF RMPS FOR ILS/DME



If both FMGCs fail, the flight crew can use the RMPs (Radio Management Panels 1 and 2) for back up tuning. Either RMP controls ILS. Prior to select an ILS frequency on one of the RMPs, the flight crew has to select “NAV” button from RMP 1 and RMP 2.

If the ILS has a DME, the PFD will not display the DME distance. In this situation, the flight crew will fly without DME information. If necessary, increase the Decision height (DH) accordingly.

Ident.: PRO-NOR-SRP-01-70-A-00004027.0001001 / 22 MAY 12
Applicable to: ALL

LOCALIZER (LOC) BEAM CAPTURE

The flight crew must always monitor the capture of a LOC beam. During this evolution, the PFD and ND must indicate that associated deviation indications move toward the centre of the scale. To avoid performing a false capture, the flight crew must be careful not to arm the LOC too early. The following graph shows the angle of interception versus distance to the runway threshold that ensures that the aircraft will not overshoot the axis by more than one and a half dot.

The capture begins when the deviation is two dots or less. It is programmed to line the aircraft up on the beam with a single overshoot, even if the intercept angle is large.

Note: *ICAO requires LOC beam to ensure a normal capture within 10 NM and plus or minus 35 ° from the course centerline. Some ILS systems just meet the requirement and are subject to false capture outside these limits.*

SWITCHING FROM NON ILS TO ILS APPROACH

Ident.: PRO-NOR-SRP-01-70-00004028.0002001 / 17 MAR 11
Applicable to: ALL

If an ILS approach is possible when a non ILS was previously scheduled, use one of the following procedures:

USE OF SECOND FLIGHT PLAN

Use a secondary flight plan to prepare the alternate ILS approach, time permitting.

COPY the ACTIVE flight plan.
REVISE the ARRIVAL: insert the ILS approach and the applicable STAR/VIA.
On the RAD NAV page, TUNE in the ILS manually.
REVISE the PERF APPR page.

CHANGE OF THE CLEARANCE

ATC changes the clearance from the non-ILS to the ILS approach.

- **If a secondary flight plan has been prepared:**
  ACTIVATE the SEC F-PLN and adjust.
  Follow subsequent standard procedures.
- **If a secondary flight plan has not been prepared:**
  REVISE the ARRIVAL on the primary F-PLN, inserting the ILS approach.
  REVISE the PERF APPR page.
  Follow subsequent standard procedures.

CAUTION	If the pilot decides to fly the ILS approach without revising the arrival of the primary flight plan (a non ILS approach is in the F-PLN), LOC and G/S modes will not be available when he presses the APPR pushbutton. Consequently, he should: • Manually TUNE in the ILS on the RAD NAV page: CHECK that the "CHECK APPR SELECTION" message comes up. • Press the ILS pushbutton and select ROSE ILS on the EIS CONTROL panel. • Use HDG, V/S or TRK, FPA modes to fly the ILS.

LANDING CATEGORIES

Ident.: PRO-NOR-SRP-01-70-00004038.0001001 / 16 NOV 11
Applicable to: ALL

Each FMGC computes its own landing category : CAT1, CAT2, CAT3 single, and CAT3 dual and displays the corresponding landing category on the FMAs.
Each category depends upon the availability of aircraft systems and functions.
When the landing capability downgrades, a triple click aural warning is activated.

FAIL-OPERATIONAL AUTOMATIC LANDING SYSTEM

An automatic landing system is fail-operational if, in the event of a failure below alert height, the remaining part of the automatic system allows the aircraft to complete the approach, flare, and landing. A CAT 3 DUAL system is a fail-operational automatic landing system.

Note: In the event of a failure, the automatic landing system operates as a fail-passive system.

FAIL-PASSIVE AUTOMATIC LANDING SYSTEM

An automatic landing system is fail-passive if, in the event of a failure, there is no significant out-of-trim condition or deviation of flight path or attitude, but the landing is not completed automatically. A CAT3 single system is a fail-passive automatic landing system.

Note: With a fail-passive automatic landing system the pilot assumes control of the aircraft after a failure.

Below 100 ft (radio altimeter), the FMGS freezes the landing capability until LAND mode is disengaged or both APs are off.
Therefore a failure occurring below 100 ft does not change the category of the system.

ALERT HEIGHT

The alert height is the height above touch down, above which a CAT3 autoland would be discontinued and a missed approach executed, if a failure occurred in either the airplane systems or the relevant ground equipments.
Below the alert height, if such a failure occurs, the flare, touchdown and roll out may be accomplished using the remaining automatic system.

WARNINGS FOR ILS APPROACH

Ident.: PRO-NOR-SRP-01-70-00004039.0010001 / 17 MAR 17

5 **Applicable to: MSN 01767-04384, 04399-09063**

AUTOLAND WARNING

With “LAND” or “FLARE” green on the FMA and at least one AP engaged, the AUTOLAND red light appears on the glareshield when the aircraft is below 200 ft RA and one of the following events occurs:

- The autopilots are lost, or
- The aircraft gets too far off the beam (LOC or G/S flash on PFD), or
- Loss of LOC signal above 15 ft, or loss of glide signal above 100 ft (transmitter or receivers), or
- The difference between both radio altimeter indications is greater than 15 ft, or
- The FMGS detects a long flare.

WARNING OF EXCESSIVE BEAM DEVIATION

This warning is a flashing of the LOC and G/S scales on the PFD and ND ROSE ILS. It occurs whenever:

- G/S deviation is greater than 1 dot (above 100 ft RA).
- LOC deviation is greater than 1/4 dot (above 15 ft RA).

WARNING ASSOCIATED WITH ILS "LANDING CAPABILITY"

Any downgrading in the aircraft’s capability for automatic approach and landing sounds a triple-click aural warning.

FAILURE OF BOTH LOCALIZER AND GLIDESLOPE RECEIVERS

The PFD and ND (rose ILS mode) display red LOC and G/S flags (if the ILS pushbutton has been pressed green). LOC and G/S scales disappear from the PFD.

If LOC or G/S modes are engaged and at least one AP/FD is engaged

- The AP disengages.
- The FD reverts to its HDG-V/S or TRK-FPA modes.

FAILURE OF LOCALIZER OR GLIDESLOPE TRANSMITTER (WHEN CAPTURED)

- The corresponding index is lost.
- The LOC and G/S scales flash.
- The corresponding FD bar flashes.

The FMA retains the LOC and G/S modes: If the transmitter failure is temporary, the APs are able to regain these modes. If the failure is long-term, or if it occurs when the aircraft is below 200 ft RA, this allows the aircraft to perform a GO AROUND with one or 2 autopilots engaged.

WARNINGS FOR ILS APPROACH

Ident.: PRO-NOR-SRP-01-70-00004039.0002001 / 17 MAR 17
Applicable to: MSN 04393-04397

AUTOLAND WARNING

With “LAND” or “FLARE” green on the FMA and at least one AP engaged, the AUTOLAND red light appears on the glareshield when the aircraft is below 200 ft RA and one of the following events occurs:

- The autopilots are lost, or
- The aircraft gets too far off the beam (LOC or G/S flash on PFD), or
- Loss of LOC signal above 15 ft, or loss of glide signal above 100 ft (transmitter or receivers).
- The difference between both radio altimeter indications is greater than 15 ft.

WARNING OF EXCESSIVE BEAM DEVIATION

This warning is a flashing of the LOC and G/S scales on the PFD and ND ROSE ILS. It occurs whenever:

- G/S deviation is greater than 1 dot (above 100 ft RA).
- LOC deviation is greater than 1/4 dot (above 15 ft RA).

WARNING ASSOCIATED WITH ILS "LANDING CAPABILITY"

Any downgrading in the aircraft’s capability for automatic approach and landing sounds a triple-click aural warning.

FAILURE OF BOTH LOCALIZER AND GLIDESLOPE RECEIVERS

The PFD and ND (rose ILS mode) display red LOC and G/S flags (if the ILS pushbutton has been pressed green). LOC and G/S scales disappear from the PFD.

If LOC or G/S modes are engaged and at least one AP/FD is engaged

- The AP disengages.
- The FD reverts to its HDG-V/S or TRK-FPA modes.

FAILURE OF LOCALIZER OR GLIDESLOPE TRANSMITTER (WHEN CAPTURED)

- The corresponding index is lost.
- The LOC and G/S scales flash.
- The corresponding FD bar flashes.

Above 200 ft RA, if the transmitter failure lasts less than 7 s, the FMA retains the LOC and G/S modes (or the LAND mode) and the APs are able to regain these modes. If the failure lasts longer than 7 s, the AP disengages and the FD reverts to its basic modes. Below 200 ft RA, if

the transmitter failure occurs, the AUTOLAND warning appears, indicating that the crew must perform a GO AROUND (if insufficient visual references) with one or 2 APs engaged.

Go-Around

MONITORING THE GO-AROUND

Ident.: PRO-NOR-SRP-01-80-00004054.0002001 / 09 DEC 09
Applicable to: MSN 04393-04397

Engage the GO-AROUND phase and GO-AROUND modes by setting the thrust levers to the TOGA position, if at least CONF1 is selected.
When the GO-AROUND phase is engaged, the previously-flown approach is automatically strung back into the flight plan at the end of the missed approach procedure.
In the GO-AROUND phase, the system makes no predictions. Consequently, CLB and DES modes are not available, and the flight crew must monitor constraints.
When the aircraft leaves the GO-AROUND phase, all predictions and modes become available again. During a GO-AROUND phase, the managed speed is Green Dot.

HEADING/TRACK PRESET FUNCTION IN GO-AROUND PHASE

The flight crew can use the heading/track preset, when LOC*, LOC, LAND, FINAL or GA is engaged.

SET the appropriate heading, or track value, in the window of the FCU.
When necessary, PULL the HDG/TRK selection knob to engage the mode on the preset value.

MONITORING THE GO-AROUND

Ident.: PRO-NOR-SRP-01-80-00004054.0005001 / 09 JUL 13
[1] **Applicable to: MSN 01767-04384, 04399-09063**

Engage the GO-AROUND phase and GO-AROUND modes by setting the thrust levers to the TOGA position, if at least CONF1 is selected.

MISSED APPROACH: TRY AGAIN

Ident.: PRO-NOR-SRP-01-80-00004057.0001001 / 14 FEB 11
Applicable to: MSN 01767-01920, 02108, 02195-02359, 02405, 02482

If the pilot intends to fly another approach to the destination:

- The flight plan has all the necessary data for the missed approach
- Green Dot is the target speed.

- **When cleared by the ATC to follow the missed approach procedure:**
  ENGAGE NAV mode, or
  TURN and PULL the HDG selector knob to set a heading
  HDG, or TRK, or NAV modes can only be engaged above 100 ft.

- **When entering the initial approach area:**
  Activate the approach phase on the MCDU's PERF GO AROUND page
  - **If the APPR phase is not activated:**
    - Managed approach speed will not be available
    - The system will not furnish predictions
    - MDA/MDH/DH displays will not appear on the PFD.

MISSED APPROACH: TRY AGAIN

Ident.: PRO-NOR-SRP-01-80-00004057.0008001 / 14 FEB 11

3 **Applicable to: MSN 01957-02097, 02121-02139, 02388, 02443-02457, 02584-09063**

If the pilot intends to fly another approach to the destination:
- The flight plan has all the necessary data for the missed approach
- Green Dot is the target speed.

- **When cleared by the ATC to follow the missed approach procedure:**
  ENGAGE NAV mode, or
  TURN and PULL the HDG selector knob to set a heading
  HDG, or TRK, or NAV modes can only be engaged above 100 ft.

- **When entering the initial approach area:**
  Activate the approach phase on the MCDU's PERF GO AROUND page
  - **If the APPR phase is not activated:**
    - Managed approach speed will not be available
    - The system will not furnish predictions
    - BARO/RADIO minima displays will not appear on the PFD.

MISSED APPROACH: DIVERT

Ident.: PRO-NOR-SRP-01-80-00004058.0001001 / 14 FEB 11

4 **Applicable to: MSN 01767-01920, 02108, 02275-02334, 02388, 02457, 02584-02670, 02737-02804, 03750, 04491, 04532, 04645, 04965-09063**

- **If the crew decides to divert to the alternate:**
  ENABLE ALTN, preferably at the TO waypoint.

- **When cleared to a waypoint:**
  PERFORM a DIRECT TO.

  The system automatically reverts to CLB phase, and modifies the target speed from Green Dot to initial speed.

  The system automatically sets the CRZ FL to the defaulted alternate CRZ FL (FL 220 or 310), and retains the previous cost index.

  The pilot may adjust these as necessary.

  Note: *Diversion may also be initiated by entering a NEW DEST in the LAT REV page at the TO waypoint, or by using the secondary F-PLN, if prepared.* *Refer to DSC-22_20-60-30 General.*

MISSED APPROACH: DIVERT

Ident.: PRO-NOR-SRP-01-80-00004058.0004001 / 14 FEB 11
Applicable to: MSN 01957-02097, 02121-02204, 02359, 02405-02443, 02482, 02712, 02908-03618, 03782-04488, 04506-04518, 04535-04637, 04752-04954

- **If the crew decides to divert to the alternate:**
  ENABLE ALTN, preferably at the TO waypoint.

- **When cleared to a waypoint:**
  PERFORM a DIRECT TO.

  The system automatically reverts to CLB phase, and modifies the target speed from Green Dot to initial speed.

  The system automatically sets the CRZ FL to the defaulted alternate CRZ FL (FL 220 or 310), The Cost Index is set to 0.0 and the message USING COST INDEX 0 is triggered.

  The pilot may adjust these as necessary.

  Note: *Diversion may also be initiated by entering a NEW DEST in the LAT REV page at the TO waypoint, or by using the secondary F-PLN, if prepared.* *Refer to DSC-22_20-60-30 General.*

Intentionally left blank

GENERAL

Ident.: PRO-SPO-20-00001883.0002001 / 04 SEP 18

[1] **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

Flight without cabin pressurization can result of:
- Dispatch under MEL
- Departure following a structural damage
- Depressurization in flight

The flight crew must decide the flight level and the airspeed depending on:
- The cause of the depressurization
- The distance to fly
- The topographic conditions
- The meteorological conditions, and
- The passengers on board the aircraft.

Revenue flight is permitted without cabin pressurization, provided that the oxygen requirements below are achieved.
After a MEL dispatch with both PACKs inoperative, the flight without cabin pressurization is permitted provided the flight is performed without passengers and with the ACTs empty.

GENERAL

Ident.: PRO-SPO-20-00001883.0001001 / 12 NOV 15

[2] **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

Flight without cabin pressurization can result of:
- Dispatch under MEL
- Departure following a structural damage
- Depressurization in flight

The flight crew must decide the flight level and the airspeed depending on:
- The cause of the depressurization
- The distance to fly
- The topographic conditions
- The meteorological conditions, and
- The passengers on board the aircraft.

Revenue flight is permitted without cabin pressurization, provided that the oxygen requirements below are achieved.
After a MEL dispatch with both PACKs inoperative, the flight without cabin pressurization is permitted provided the flight is performed without passengers.

FUEL TRANSFER

Ident.: PRO-SPO-20-00006150.0002001 / 04 SEP 18

3 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

Dispatch for a flight without pressurization is not allowed with fuel in any ACTs.
In case of Pressurization failure in flight, automatic fuel transfer from the ACT(s) to the center tank will not occur. The “ACT XFR FAULT” ECAM caution will be triggered to indicate that the automatic transfer is failed. The flight crew must follow the ECAM caution to perform a manual fuel transfer.

OXYGEN REQUIREMENTS

Ident.: PRO-SPO-20-00001884.0001001 / 21 MAR 17

Applicable to: ALL

CREW MEMBERS

See FAR 121.329 or AIR-OPS CAT.IDE.A.235

PASSENGERS

For flight at cabin pressure altitudes above 10 000 ft, up to and including 14 000 ft, there must be enough oxygen to supply 10 % of the passengers for the flight at those altitudes that lasts more than 30 min.
For flight at cabin pressure altitudes above 14 000 ft, up to and including 15 000 ft, there must be enough oxygen for 30 % of the passengers.
For flight at cabin pressure altitudes above 15 000 ft, there must be enough oxygen for all passengers.

FLIGHT PLANNING AND EXECUTION

Ident.: PRO-SPO-20-A-00001981.0001001 / 21 MAR 17

Applicable to: ALL

ALTITUDE

Flight route planning should consider the above-stated restriction in cabin altitude. If cabin altitude exceeds 9 550 ± 350 ft, the EXCESS CAB ALT warning on the ECAM will be activated. When above 14 000 ft, the passenger oxygen masks will drop automatically. Therefore, the recommended maximum altitude for prolonged flight is FL 100. The minimum altitude should be selected by respecting :

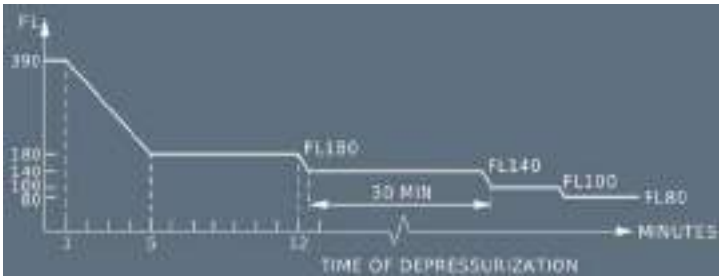
- The Minimum Safe Altitude (MSA),
- Turbulence, which is uncomfortable for passengers and,
- Low Outside Air Temperature (OAT), which can be uncomfortable for passengers when the cabin is ventilated by ram air only.

Ident.: PRO-SPO-20-A-00001983.0001001 / 21 MAR 17
Applicable to: ALL

AIRSPEED

If decompression is due to structural damage, consider airspeed reduction. Use slats and flaps, as necessary, to establish low speed conditions. In addition, turbulent conditions are uncomfortable for passengers, and gust response should be minimized by reducing airspeed.

Ident.: PRO-SPO-20-A-00001984.0001001 / 21 MAR 17
Applicable to: ALL

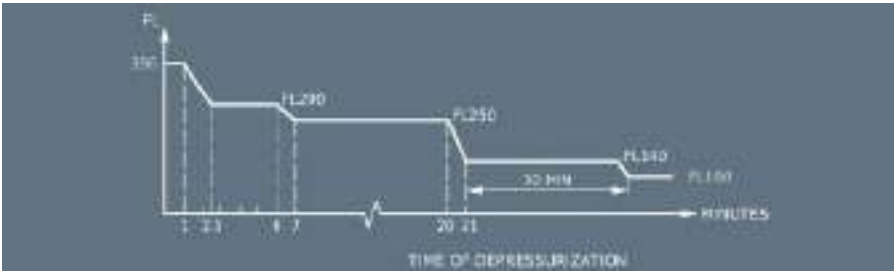


CLIMB AND DESCENT RATE

Takeoff must be performed normally, and the rate of climb must be limited to about 500 ft/min, to ease the pressure change felt by passengers and crew.
Likewise, the rate of descent must be limited to about 1 000 ft/min, except for the final approach which must be performed normally. Notify the ATC of any performance deficiency by a remark in the flight plan.

Ident.: PRO-SPO-20-A-00001985.0001001 / 21 MAR 17
[4] **Applicable to: MSN 01767-04312, 04328-04384, 04433, 04481-09063**

EMER DESCENT IN CASE OF RAPID DEPRESSURIZATION



In the event of depressurization, oxygen is supplied to passengers through an individual mask. The capacity of the units is such that the aircraft must descend and remain below the following profile.

Ident.: PRO-SPO-20-A-00001985.0004001 / 21 MAR 17
Applicable to: MSN 04314, 04393-04399, 04438

EMER DESCENT IN CASE OF RAPID DEPRESSURIZATION

In the event of depressurization, oxygen is supplied to passengers through an individual mask. The capacity of the units is such that the aircraft must descend and remain below the following profile.

SYSTEMS

Ident.: PRO-SPO-20-00001990.0005001 / 04 DEC 18
Applicable to: MSN 01957-02097, 02121, 02138, 02457

FAILURE OCCURRING IN FLIGHT

Apply the abnormal and emergency procedures required by ECAM.

FAILURE PRESENT AT DISPATCH

- **If flight with both packs inoperative**

  In this case, the flight must be performed with no passengers

  PACK 1 and 2.....OFF
  RAM AIR.....ON

  Note: If the "AVIONICS SMOKE" procedure has to be applied, the following flight time limitations have to be considered to protect the avionic equipment :
  At ISA +40 : 0.5 h
  At ISA +30 : 1.5 h
  At ISA +20 : 4 h
  At ISA +10 and below : No limitation.

  MAX FL.....100 or MSA

- **If both CAB PRESS systems are inoperative, or if there is structural damage :**
  PACK 1 and 2.....ON
  MODE SEL.....MAN
  V/S CTL.....AS RQRD
  Use V/S CTL pb to set the outflow valve opening to 50 %.
  OUTFLOW VALVE HALF OPEN.....CHECK
  The outflow valve opening is limited to 50 %, to prevent the cabin air suction effect.

MAX FL.....100 or MSA

Between FL 80 and FL 150, oxygen must be provided for 2 % of the passengers. This is provided by the portable oxygen system. When it is no longer available, descend to FL 80. For performance at FL 80/250 kt : Use data for FL 100/LRC (Refer to PER-CRZ-CRT-30 LONG RANGE CRUISE - ISA) and increase fuel consumption by 6 %.

TAKEOFF

Limit the aircraft's rate of climb to about 500 ft/min.

CLIMB

Note: The EXCESS CAB ALT warning may occur.
Use the ECAM CLR pb to clear the warning.

DESCENT

- **At top of descent, if engine anti-ice (side with ENG BLEED pb-sw OFF) is available:**
  ANTI ICE ENG (side with ENG BLEED pb-sw OFF) pb-sw.....ON

Limit the aircraft's rate of descent to about 1 000 ft/min. Perform the final approach normally.

FAILURE OCCURRING IN FLIGHT

Apply the abnormal and emergency procedures required by ECAM.

FAILURE PRESENT AT DISPATCH

- **If flight with both packs inoperative:**

  In that case, the flight must be performed with no passengers.

  PACK 1 and 2.....OFF
  RAM AIR.....ON

  Note: If the "AVIONICS SMOKE" procedure has to be applied, the following flight time limitations have to be considered to protect the avionic equipment :
  At ISA +40 : 0.5 h
  At ISA +30 : 1.5 h
  At ISA +20 : 4 h
  At ISA +10 and below : No limitation.

  MAX FL.....100 or MSA

- **If both CAB PRESS systems are inoperative, or if there is structural damage:**

TEST OF THE MANUAL OPERATION OF THE OUTFLOW VALVE ON GROUND:

PACK 1 pb-sw and PACK 2 pb-sw..... OFF
OUTFLOW VALVE FULLY OPEN.....CHECK

Check that the outflow valve is fully open on the CAB PRESS SD page

RPCU CB (X23 ON 122VU)..... PULL
MODE SEL pb.....MAN
MAN V/S CTL..... DN

Check that the outflow valve is fully closed on the CAB PRESS SD page

MAN V/S CTL.....UP

Check that the outflow valve is fully open on the CAB PRESS SD page

MODE SEL pb.....AUTO
RPCU CB (X23 ON 122VU)..... PUSH
PACK 1 pb-sw and PACK 2 pb-sw..... ON
MAX FL.....100 or MSA

Between FL 80 and FL 150, oxygen must be provided for 2 % of the passengers. This is provided by the portable oxygen system. When it is no longer available, descend to FL 80. For performance at FL 80/250 kt : Use data for FL 100/LRC (Refer to PER-CRZ-CRT-30 LONG RANGE CRUISE - ISA) and increase fuel consumption by 6 %.

TAKEOFF

Limit the aircraft's rate of climb to about 500 ft/min.

- **If both CAB PRESS systems are inoperative, or if there is structural damage:**
  - **WHEN IN CLEAN CONFIGURATION:**

MODE SEL pb..... MAN
V/S CTL sw.....AS RQRD

Use V/S CTL pb to set the outflow valve opening to 50 %.

OUTFLOW VALVE HALF OPEN..... CHECK

The outflow valve opening is limited to 50 %, to prevent the cabin air suction effect.

CLIMB

Note: The EXCESS CAB ALT warning may occur.
Use the ECAM CLR pb to clear the warning.

DESCENT

- **At top of descent, if engine anti-ice (side with ENG BLEED pb-sw OFF) is available:**

ANTI ICE ENG (side with ENG BLEED pb-sw OFF) pb-sw.....ON

Limit the aircraft's rate of descent to about 1 000 ft/min. Perform the final approach normally.

PERFORMANCE DATA

Ident.: PRO-SPO-20-00001991.0001001 / 10 JAN 11

7 **Applicable to: MSN 01957-02359, 02405-02482, 02609-02670, 02737-03071, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

The following table enables the fuel consumption and the time needed from takeoff to landing to be determined in case of flight without cabin pressurization.

The table is established for :
- Takeoff
- Climb from 1 500 ft at 250 kt
- Long range cruise speed at FL 100

- Descent to 1 500 ft at 250 kt
- Approach and landing : IMC procedure 120 kg or 260 lb (6 min)
- ISA temperature
- CG = 25 %
- Normal air conditioning
- Anti ice OFF

The table (*Refer to PRO-SPO-20 Ground Distance/Air Distance Conversion*) gives the conversion from ground distance to air distance

Note: For each degree Celcius above ISA temperature apply a correction of 0.01 (kg/°C/NM) or 0.022 (lb/°C/NM).

PERFORMANCE DATA

Ident.: PRO-SPO-20-00001991.0002001 / 10 JAN 11

GENERAL

Ident.: PRO-SPO-40-10-00002029.0001001 / 23 JUN 15
Applicable to: ALL

The system design and the reliability of the engine installation of this airplane comply with the criteria for Extended Twin Operations (ETOPS) flights set forth in AMC 20-6 rev. 2 (EASA) or FAR 25.1535 (FAA), when the aircraft is configured, maintained and operated in accordance with the Airbus CMP (Configuration, Maintenance and Procedure) document.

This statement of ability does not constitute an approval to conduct Extended-Range Operations.

The ETOPS EXTENDED OPERATIONS Chapter of the AFM APPENDICES AND SUPPLEMENTS Section refers to the approved Standard for Extended-Range Operations and the applicable limitations, procedures and performance references.

The operator is responsible for showing that he is complying with the regulation of his nation and for obtaining operational approval from his national authorities. The operator may amend this chapter, as needed.

The airplane must be configured in accordance with the Airbus Standard for Extended-Range Operations. However, the authorities may under certain conditions allow the operator to conduct ETOPS flights with limited maximum diversion time (for example, 75 min diversion time in a benign area of operation) without showing full compliance with these standards.

Intentionally left blank

DEFINITIONS

Ident.: PRO-SPO-40-20-00002031.0001001 / 23 JUN 15
Applicable to: ALL

For the purpose of EU-OPS 1-245 and FAR 121-161, Extended-Range Operations are those intended to be conducted over a route that contains a point beyond 60 min from an adequate airport at the selected one-engine-inoperative speed in still air and ISA (or prevailing delta ISA) conditions.
An adequate airport is an airport which satisfies the aircraft performance requirements applicable at the expected landing weight, and sufficiently equipped to be safely used. In particular, at the anticipated time of use, it should be available and equipped with the necessary services, including ATC, weather information, navaids and emergency services.
An ETOPS (en-route) alternate airport is a confirmed adequate airport which satisfies the dispatch weather minima requirements for ceiling and visibility within the required validity period.

AREA OF OPERATION

Ident.: PRO-SPO-40-20-00002032.0001001 / 21 MAR 17
Applicable to: ALL

The ETOPS area of operations is the airspace within which the distance to an ETOPS adequate airport is less than the ETOPS Max Diversion distance.
The ETOPS maximum diversion distance from an adequate airport must be determined for ISA (or prevailing delta ISA) and no-wind conditions, taking into account aircraft performance with one engine inoperative and the remaining engine operating at MCT.
To determine the ETOPS maximum diversion distance from an adequate airport, the operator must define a One Engine Inoperative diversion speed for performance computation.

The same approved one-engine-inoperative diversion speed (*Refer to PER-OEI-GEN STRATEGY*) must be considered for :
- Establishing the area of operation,
- Calculating the single-engine fuel planning,
- Conducting the diversion in case of engine failure (conditions permitting).

The operator has to define an aircraft weight at diversion that is considered for the ETOPS Maximum Diversion Distance calculation. This aircraft weight can be taken as a representative but conservative value of the aircraft gross weight at the critical point of the route or at the various critical points of all the routes included in a given sector.
The approved one-engine-inoperative descent and cruise speed must be chosen so that the associated net flight path clears the en-route obstacles with the regulatory margin. However, a speed other than the approved one-engine-inoperative speed may be used as the basis for obstacle clearance as long as the fuel required with that speed is covered by the critical fuel scenario.
*Refer to PER-OEI-GEN STRATEGY*for these two one-engine-inoperative speeds.

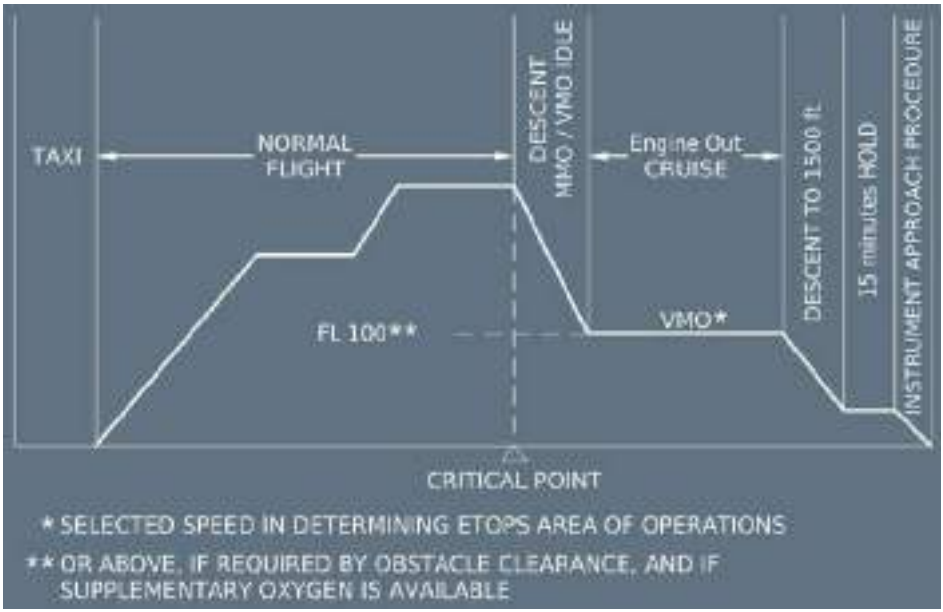
When the one-engine-inoperative diversion speed is chosen, the maximum distance from a diversion airport, can be directly determined for different maximum diversion times, with the help of the tables provided in this section. The area of possible ETOPS operation can then be drawn on plotting charts.
Another way to determine the maximum distance to a diversion airport is to read the one-engine-inoperative cruise TAS (for the reference gross weight and at the FL for best TAS) in the cruise tables (*Refer to PER-OEI-GEN STRATEGY*) taking into consideration the appropriate speed strategy and the minimum altitude for clearing possible obstacles. The maximum distance the aircraft can travel to a diversion airport is this one-engine-inoperative-TAS multiplied by the maximum allowed diversion time granted to the operator.
Operators whose authorities require that an approved one-engine-inoperative speed be published in the Flight Manual must use this approved speed.

MMEL

Ident.: PRO-SPO-40-30-00002035.0001001 / 03 DEC 13
Applicable to: ALL

The MMEL has been approved taking into consideration the duration of the average ETOPS flight and the maximum diversion time granted to the airframe/engine combination.
The MMEL published by Airbus and approved by the EASA can be used to establish the airline MEL, which must be approved by the operator's national authorities.
This MEL will probably be adapted to the airline network, environment and organization.

Other determining parameters will be :



- The maximum and the average diversion times on the route.
- The equipment of the enroute alternates.
- The navigation and communication facilities.
- The average meteorological conditions.

ETOPS FUEL SCENARIOS

Ident.: PRO-SPO-40-30-00012899.0001001 / 23 JUN 15
Applicable to: ALL

According to EASA AMC20-6 rev 2 and FAA121.646 for establishing the ETOPS critical fuel reserves, the operator must consider three diversion scenarios:

- Pressurization Failure + Engine Failure

- Pressurization Failure
  Same Flight Profile as above, but all engines operating and Diversion Cruise Speed* set to LRC.
- Engine Failure
  Same Flight Profile as above, but standard descent speed and Diversion Cruise at the FL** appropriate to gross engine out ceiling at the selected ETOPS diversion speed.
- FAA Fuel Requirements
  For the first two scenarios, involving depressurization, the required block fuel must be calculated in accordance with the operator's ETOPS fuel policy and using the regulatory ETOPS critical fuel reserves *Refer to PRO-SPO-40-30 ETOPS Critical Fuel Reserves*.
  Depending on the approved one-engine-inoperative speed selected for the single-engine diversion strategy, either of these two scenarios may result in the higher fuel requirement.
  The scenario resulting in the higher fuel requirement is called the ETOPS critical fuel scenario, and the associated minimum block fuel requirement is the ETOPS critical fuel plan.
  Note that, it is not necessary to calculate the 3rd scenario (engine failure), as this scenario is never critical, due to the higher diversion flight level.

ETOPS CRITICAL FUEL RESERVES

Ident.: PRO-SPO-40-30-00012901.0001001 / 23 JUN 15
Applicable to: ALL

For the computation of the ETOPS critical fuel reserves and of the complete ETOPS critical fuel planning according to EASA AMC 20-6 rev 2 and FAR 121.646, the diversion fuel must include the following fuel provisions:

- Fuel burn-off from the critical point to the end of descent at the alternate airport
- Fuel for 15 min of holding at 1 500 ft and green dot speed at the alternate
- Fuel for an instrument approach and landing
- Fuel to account for errors in wind forecasting (5 % wind speed factor on actual forecast wind speeds or 5 % fuel if actual forecast wind speeds are not used)
- Fuel to account for aircraft deterioration (use a demonstrated performance factor or 5 %)
- Fuel to account for any Configuration Deviation List (CDL) or MEL item
- Fuel to account for Icing Effects (if forecast) for the critical mission
- Fuel to account for APU use (only for the one-engine-inoperative scenario, if APU is operative)

WIND ERRORS

A 5 % wind speed factor (i.e. an increment to headwind or a decrement to tailwind) on the actual forecast wind should be used to account for potential errors. However if the operator is not using the actual forecast wind based on a wind model acceptable to the certification authorities then 5 % of the fuel for the critical scenario is required as a reserve fuel.

ICING

The most critical scenario must be compensated for the greater of:

A. The effect of airframe icing during 10 % of the time during which icing is forecast, including ice accumulation on unprotected surfaces, and the fuel used by engine and wing anti-ice during this period.

B. Fuel for engine and wing anti-ice for the entire time during which icing is forecast.

Note: The ETOPS icing fuel reserve is always limited by (B)

Unless a reliable icing forecast is available, icing may be presumed to occur when the Total Air Temperature (TAT) is less than +10 °C, or if the outside air temperature is between 0 °C and -20 °C with a relative humidity of 55 % or more.

APU

Fuel consumption of 80 kg/h / or 176 lb/h (APU GEN ON, APU BLEED OFF).

In view of our experience, Airbus recommends that the operator includes a contingency fuel provision from departure to the Critical Point (CP), when computing the ETOPS critical fuel planning.

ETOPS FUEL REQUIREMENTS

Ident.: PRO-SPO-40-30-00012902.0001001 / 17 NOV 11
Applicable to: ALL

The operator must compare the entire ETOPS critical fuel planning for the ETOPS critical fuel scenario with the standard fuel planning computed in accordance with the company fuel policy and applicable operational requirements. The higher of the two fuel requirements must be considered as the minimum required block fuel for the flight.

WEATHER MINIMA

Ident.: PRO-SPO-40-30-00002046.0001001 / 23 JUN 15
Applicable to: ALL

Weather forecasts for en-route alternates must meet the operator's applicable weather minimum requirements.
This paragraph provides the applicable minima required by EASA (EU-OPS 1/AMC 20-6 rev. 2) and FAA (AC120-42B).

A. EASA DISPATCH WEATHER MINIMA (EU-OPS 1/AMC 20-6 REV. 2)

An airplane cannot be dispatched unless the meteorological forecasts at ETOPS en-route alternate airports meet the weather minima listed here for a period commencing at the earliest potential time of landing and ending one hour after the latest expected time of landing:

Approach Type	Min ETOPS Ceiling	Min ETOPS Visibility
Precision approach	DH/DA +200 ft	Authorised visibility +800 m
Non-Precision or Circling approach	MDH/MDA +400 ft	Authorised visibility +1 500 m
CAT II/CAT III approach	Specific approval required	Specific approval required

B. FAA DISPATCH WEATHER MINIMA (AC 120-42B)

An airplane cannot be dispatched unless the meteorological forecasts at ETOPS en-route alternate airports meet the weather minima listed here for a period commencing at the earliest potential time of landing and ending at the latest expected time of landing:

Approach Type	Min ETOPS Ceiling	Min ETOPS Visibility
Two or more instrument approaches	Higher of the two (M)DH/DA +200 ft	Higher of the two authorised visibility +800 m
Single Precision approach or Non-Precision approach or Circling approach	(M)DH/DA +400 ft	Authorised visibility +1 600 m
CAT II approach	300 ft	1 200 m or RVR1 200 m
CAT III approach	200 ft	800 m or RVR550 m

Intentionally left blank

DIVERSION DECISION MAKING

Ident.: PRO-SPO-40-40-00002048.0001001 / 21 MAR 17
Applicable to: ALL

The technical criteria governing a re-routing or diversion decision can be classified into four categories, as follows :

- Loss of MNPS capability, before entering the MNPS area (as applicable).
- Weather minima at diversion airport(s) going below the company/crew en-route minima, before reaching the ETOPS Entry Point, or diversion airport(s) becoming unsuitable for any reason.
- Failure cases requiring a diversion to the nearest airport (cases leading to a LAND ASAP message on the ECAM and/or in the QRH).
- Failure cases resulting in increased fuel consumption, exceeding the available fuel reserves.

Comments and Recommendations

- Electrical generation

  If one IDG fails, a diversion is required in case of :
  - Blue hydraulic circuit low level, low pressure or overheat, or
  - APU no start, or
  - APU or APU generator inoperative, or
  - Second IDG failure.

- Fuel system
  Some failure cases may lead to fuel gravity feeding which implies flight at lower altitude or to some fuel being unusable. The flight crew's evaluation of the actual situation and the fuel remaining may lead to the decision that a diversion is required.
- Hydraulic system :

  If low level, low pressure or overheat on blue hydraulic circuit, a diversion is required in case of :
  - One IDG failure, or
  - APU no start, or
  - APU/APU GEN failure.

- APU :

  If APU/APU GEN fails, a diversion is required in case of :
  - Blue hydraulic circuit low level, low pressure or overheat, or
  - One IDG failure.

DIVERSION PERFORMANCE DATA

Ident.: PRO-SPO-40-40-00002049.0001001 / 21 MAR 17
Applicable to: ALL

Chapter PER-OEI-GEN contains three single engine descent and cruise procedures:
1. The standard strategy,
2. The obstacle strategy,
3. Fixed speed strategies (ETOPS).

For ETOPS operations, any one of the above diversion strategies can be used provided that the selected strategy and speed schedule are used in :
- Establishing the area of operation (maximum diversion distance),
- Calculating the diversion fuel requirements for the single-engine ETOPS fuel scenario,
- Demonstrating the applicable obstacle clearance requirements (net flight path and net ceiling).

During the diversion, the flight crew is expected to use the planned speed schedule.
However, based on the evaluation of the actual situation, the pilot in command has the authority to deviate from this planned one-engine-inoperative speed.

GUIDELINES FOR DIVERSION PROCEDURE

Ident.: PRO-SPO-40-40-00002050.0001001 / 21 MAR 17
Applicable to: ALL

- Complete the related failure procedure,
- Inform ATC,
- Initiate the descent,
- Determine which en route alternate is the most suitable (per company procedure),
- Divert to the chosen en route alternate,
- Comply with the pre-planned diversion strategy and speed schedule, or adjust the speed schedule, as dictated by the evaluation of the actual situation.

Note: *For detailed guidelines and procedures for conducting the diversion (lateral and vertical navigation),* *Refer to DSC-22_20-60-30 - How to Execute a Diversion.*

GENERAL

Ident.: PRO-SPO-40-50-00002051.0001001 / 26 JUN 17
Applicable to: ALL

For ETOPS flights, the flight crew must apply the below procedures, in addition to the SOP (refer to chapter PRO-NOR-SOP) and the ABNORMAL and EMERGENCY procedures (refer to chapter PRO-ABN).

NORMAL PROCEDURES

Applicable to: ALL

Ident.: PRO-SPO-40-50-A-00021794.0002001 / 26 JUN 17

COCKPIT PREPARATION

FUEL

Before each ETOPS flight, the flight crew must check that the fuel crossfeed valve is operating correctly :

FUEL X FEED .....ON

On the ECAM FUEL page, check that the fuel crossfeed valve is open (indication is inline green).

FUEL X FEED..... OFF

Check that the fuel crossfeed valve is closed.

ABNORMAL AND EMERGENCY PROCEDURES

Ident.: PRO-SPO-40-50-00002053.0006001 / 05 JUN 18

[1] **Applicable to: MSN 01957-02359, 02405-02482, 02609-02670, 02737-03071, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-06336**

ELECTRICAL EMERGENCY CONFIGURATION

The flight crew must complete the ECAM procedure using the following:

AIR CONDITIONING

As cockpit and cabin temperature control is lost, it is recommended to open the cockpit door.

FUEL

As all fuel pumps are lost, the engines are fed by gravity. *Refer to GRVTY FUEL FEEDING Procedure*.

ENGINE ANTI-ICE

Engine anti-ice valves are permanently open, although the ECAM memo ENG A. ICE is not displayed on the ECAM (except if the ENG A. ICE pb is at ON).

WING ANTI-ICE

If only one ENG BLEED is available, PACK 1 must be switched OFF, to avoid having both packs and wing anti-ice supplied by a single bleed source.

ENGINE

As the engines are in degraded N1 mode, the power setting has to be done using tables given in *Refer to PER-THR-N1 N1 MODE THRUST CONTROL*and following.

BLUE HYDRAULIC CIRCUIT LOW LEVEL OR LOW PRESSURE OR OVERHEAT

Start the APU to ensure availability of the APU generator.

ENGINE OR IDG FAILURE

Start the APU and use the APU electrical channel.

LOSS OF AIR CONDITIONING

In the case of loss of the air conditioning capability (loss of both packs, loss of both bleeds without APU bleed etc.), when at FL 100 with the RAM AIR opened, the CAB FANS must be switched off.

ABNORMAL AND EMERGENCY PROCEDURES

Ident.: PRO-SPO-40-50-00002053.0004001 / 05 JUN 18
Applicable to: MSN 01767-01920, 02388, 02584, 02712, 03138, 03750, 04294, 04314, 04393-04438, 04510

ELECTRICAL EMERGENCY CONFIGURATION

The flight crew must complete the ECAM procedure using the following:

AIR CONDITIONING

As cockpit and cabin temperature control is lost, it is recommended to open the cockpit door.

FUEL

As all fuel pumps are lost, the engines are fed by gravity. *Refer to GRVTY FUEL FEEDING Procedure*.

ENGINE ANTI-ICE

Engine anti-ice valves are permanently open, although the ECAM memo ENG A. ICE is not displayed on the ECAM (except if the ENG A. ICE pb is at ON).

WING ANTI-ICE

If only one ENG BLEED is available, PACK 1 must be switched OFF, to avoid having both packs and wing anti-ice supplied by a single bleed source.

BLUE HYDRAULIC CIRCUIT LOW LEVEL OR LOW PRESSURE OR OVERHEAT

Start the APU to ensure availability of the APU generator.

ENGINE OR IDG FAILURE

Start the APU and use the APU electrical channel.

LOSS OF AIR CONDITIONING

In the case of loss of the air conditioning capability (loss of both packs, loss of both bleeds without APU bleed etc.), when at FL 100 with the RAM AIR opened, the CAB FANS must be switched off.

ABNORMAL AND EMERGENCY PROCEDURES

Ident.: PRO-SPO-40-50-00002053.0011001 / 21 MAR 17

2 **Applicable to: MSN 06720-09063**

ELECTRICAL EMERGENCY CONFIGURATION

The flight crew must complete the ECAM procedure using the following:

AIR CONDITIONING

As cockpit and cabin temperature control is lost, it is recommended to open the cockpit door.

FUEL

As all fuel pumps are lost, the engines are fed by gravity. *Refer to GRVTY FUEL FEEDING Procedure*.

ENGINE ANTI-ICE

Engine anti-ice valves are permanently open, although the ECAM memo ENG A. ICE is not displayed on the ECAM (except if the ENG A. ICE pb is at ON).

[1] **Applicable to: MSN 01957-02359, 02405-02482, 02609-02670, 02737-03071, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-06336**

In case of electrical emergency configuration, the remaining engine reverts to degraded N1 mode. Consequently the penalties on net ceilings (*Refer to PER-THR-N1 MAXIMUM TAKEOFF N1*) must be taken into account for ETOPS part of the flight.

The two following cases result in a fuel consumption increase:
- RAT extended
- In electrical emergency configuration, the engine anti-ice valves are permanently open.

MAXIMUM DIVERSION DISTANCE

Ident.: PRO-SPO-40-60-00002055.0256001 / 21 MAR 17
Applicable to: MSN 05437-06336

The following computation conditions have been used in accordance with the interpretation of the EU-OPS 1.245 and FAR 121.161:

- ISA conditions
- No wind
- Optimum diversion level after engine failure
- Single engine diversion speed schedule.

Note: Obstacles have not to be considered to determine if a route is or is not an ETOPS route.

- Holding 15 min at FL 15

- IFR procedure
- APU fuel burn.

Not included: 5 % correction on wind value - Anti icing if icing is forecast - performance factor.

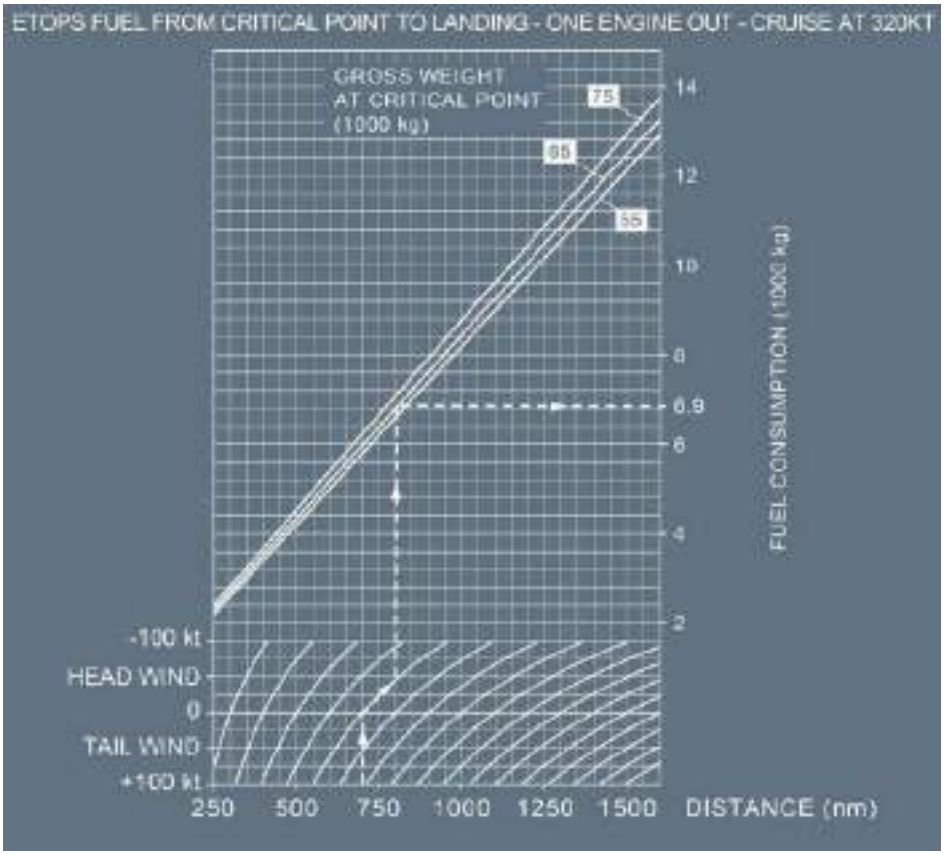
ETOPS FUEL REQUIREMENT FROM CRITICAL POINT TO LANDING - EXAMPLE

Ident.: PRO-SPO-40-60-00014769.0001001 / 21 MAR 17
Applicable to: ALL

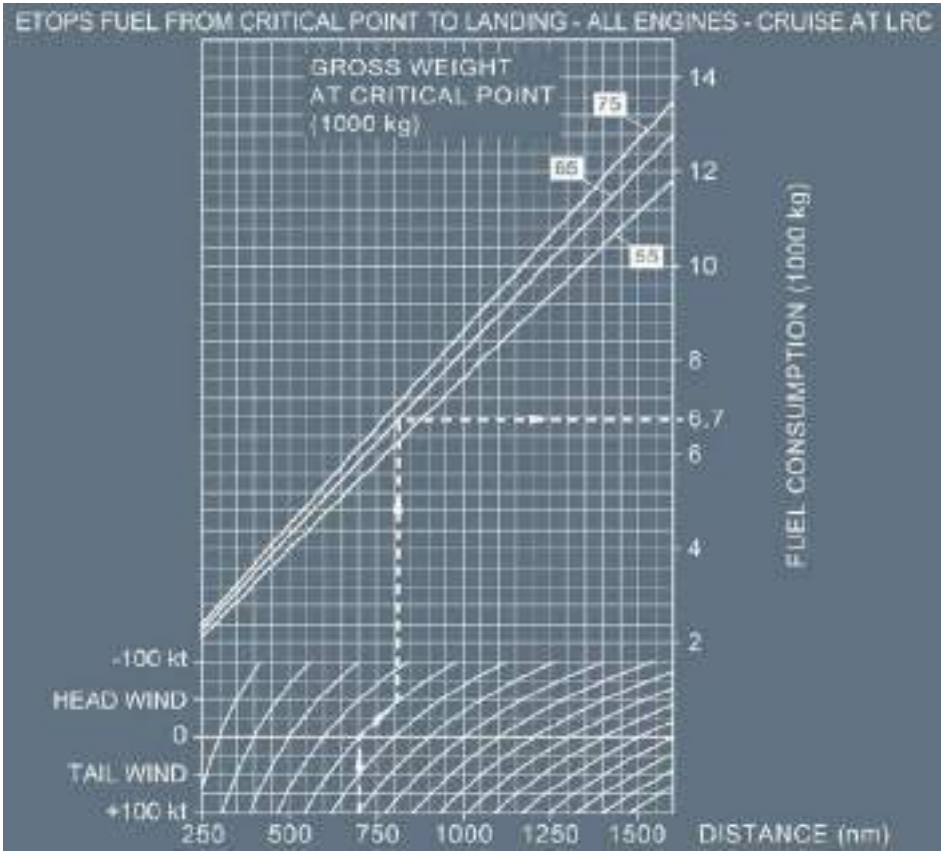


Note: The following data and graphs are for example only, and are not for operational use. Even if the data in the following example is in "kg", the same method can be applied for "lb".

Assumptions:
- Aircraft weight at critical point: 65 000 kg
- Diversion speed: 320 kt
- Diversion time: 120 min
- Distance from Critical point to diversion airport: 700 NM
- Wind: 50 kt headwind
- Forecasted icing condition on diversion: 40 min
- Aircraft perf factor: 5 %

For the determination of the ETOPS fuel requirement, the greatest fuel quantity of the two following scenarios must be considered (the scenario Engine failure only, without pressurization failure, is never limiting):

1. Pressurization failure - One Engine Inoperative - 320 kt



- Determine the corrected wind for diversion taking into account the 5 % wind speed factor: 50 x 1.05 = 52.5 kt
- Enter the ETOPS Fuel from Critical Point to Landing - One Engine Out - Cruise at 320kt graph to determine the corresponding fuel consumption: 6 900 kg

- Determine the final ETOPS fuel requirement, sum of perf factor fuel, icing fuel and fuel determined the step before:
  - Fuel for icing condition (Total anti-ice scenario is limiting): 3.5 % x 40 / 120 = 1.17 %
  - Fuel for perf factor: 5 %
  - Final ETOPS fuel requirement: 6 900 x 1.0117 x 1.05 = 7 330 kg

2. Pressurization failure - All Engines Operative - LRC speed

- Determine the corrected wind for diversion taking into account the 5 % wind speed factor: 50 x 1.05 = 52.5 kt
- Enter the ETOPS Fuel from Critical Point to Landing - All Engines - Cruise at LRC graph to determine the corresponding fuel consumption: 6 700 kg

- Determine the final ETOPS fuel requirement, sum of perf factor fuel, icing fuel and fuel determined the step before:
  - Fuel for icing condition (total anti-ice scenario is limiting): 6 % x 40 / 120 = 2 %
  - Fuel for perf factor: 5 %
  - Final ETOPS fuel requirement: 6 700 x 1.02 x 1.05 = 7 176 kg

The final ETOPS fuel requirement for this diversion is 7 330 kg. The limiting scenario is a pressurization failure and One Engine Out at a diversion speed of 320 kt.

Intentionally left blank

FADEC INTERMIX OPERATIONS

Ident.: PRO-SPO-43-00022711.0002001 / 05 NOV 18

[1] **Applicable to: MSN 06720-09063**

FADEC intermix operations between FADEC FCS4.4 standard and subsequent can present the following cockpit effects during engine operation due to a different oil system management. On FADEC FCS4.4 side:

- Oil temperature higher by approximately 40 °C.
- Oil quantity higher by approximately 5 QT.

These differences do not impact engines normal operations. For oil characteristics limitations, *Refer to LIM-ENG Oil* .

Intentionally left blank

ENGINE INTERMIX TYPE 1

Applicable to: MSN 01767-01920, 02388, 02584, 02712, 03138, 03750, 04294, 04314, 04393-04438, 04510

Ident.: PRO-SPO-45-A-00002059.0001001 / 30 JUN 14

The following information provides the conditions and procedures necessary in order to temporarily operate an A318/A319/A320/A321 aircraft when a CFM56–5B Single Annular Combustor (SAC) engine is intermixed with a CFM56–5B Double Annular Combustor (DAC) engine.
This engine intermix configuration is indicated in the cockpit with the following placard: “CAUTION: ENGINE INTERMIX TYPE 1” or "CAUTION: ENGINE INTERMIX".

Ident.: PRO-SPO-45-A-00002060.0001001 / 07 DEC 10

ENGINE PARAMETERS

Engine parameters differ significantly, when the engines are at idle:

EGT	:	Up to 250 °C higher on the DAC engine.
FUEL FLOW	:	Up to 25 % higher on the DAC engine.
N1	:	Higher on the DAC engine.
N2	:	Lower on ground on the DAC engine; higher in flight on the DAC engine.

Ident.: PRO-SPO-45-A-00002061.0001001 / 07 DEC 10

CROSSBLEED ENG START

The DAC engine has insufficient acceleration capability to sustain idle speed with a large bleed offtake, when it operates with only 20 injectors. Therefore, it is necessary to preset a 30 % N1 on the supplying engine before launching the start sequence.

Ident.: PRO-SPO-45-A-00004068.0001001 / 07 DEC 10

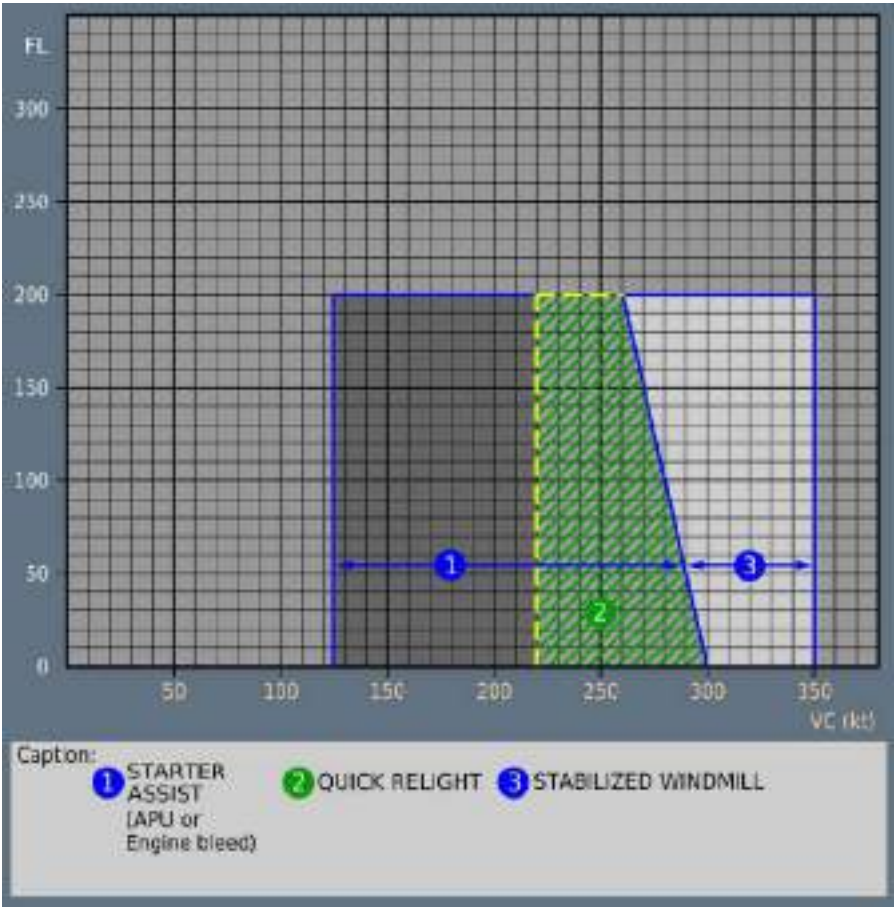
TAKEOFF PROCEDURE

- The PF must progressively adjust engine thrust in two steps:
  - Step 1 : Idle to 50 % N1.
    Brakes released, when the 50 % N1 is stabilized on both engines.
  - Step 2 : Both engines N1 to takeoff thrust.

  This procedure enables a significantly slower acceleration from ground idle to N1 = 50 % for the double annular combustor.
- Other standard operating procedures apply for takeoff.

Ident.: PRO-SPO-45-A-00002062.0001001 / 07 DEC 10

ENGINE RESPONSE



In flight, when the aircraft is in clean configuration, the DAC engine may accelerate from idle more slowly than the SAC engine. This is particularly evident, if the acceleration follows a deceleration.

There is no significant effect on aircraft handling. This difference in engine response disappears when the slats are extended.

Ident.: PRO-SPO-45-A-00004067.0001001 / 09 OCT 12

ENGINE RELIGHT

The DAC engine relight envelope is more restrictive than the SAC engine relight envelope. Therefore, in case of engine intermix, the flight crew must use the DAC engine relight procedure with the corresponding chart (See chart below).

ENGINE INTERMIX TYPE 2

Applicable to: MSN 01767-01920, 02388, 02584, 02712, 03138, 03750, 04294, 04314, 04393-04438, 04510

Ident.: PRO-SPO-45-B-00012731.0007001 / 06 MAR 17

The following information provides the necessary conditions and procedures in order to temporarily operate an A318/A319/A320/A321 with engine intermix configuration between two different SAC engines among CFM56–5Bx classic, the CFM56–5Bx/P, the CFM56-5Bx/3 and the CFM56-5Bx/P "TI HPC kit".
FADEC intermix configuration 5BM software (installed on CFM56-5B classic) with FADEC 5BR software is indicated in the cockpit with the following placard: "CAUTION: ENGINE INTERMIX TYPE 2".

Note: *When FADEC Standard "5BR" or subsequent is installed on both engines, engine thrust behavior is harmonized (transient thrust dissymmetry no longer exist). Therefore, a placard is not necessary and is not displayed.*

Ident.: PRO-SPO-45-B-00012732.0001001 / 07 DEC 10

ENGINE PARAMETERS

In the case of only one operative pack configuration (only one pack OFF):

- N1 : At idle up to 9 % higher on the CFM56-5B/3 TI engine, on ground or in flight in clean configuration.
- N2 : At idle up to 11 % higher on the CFM56-5B/3 TI engine, on ground or in flight in clean configuration.

Ident.: PRO-SPO-45-B-00012733.0001001 / 07 DEC 10

TAKEOFF PROCEDURE

In the case of only one operative pack configuration, due to the difference in N2 at idle between engines, the following takeoff procedure is recommended:

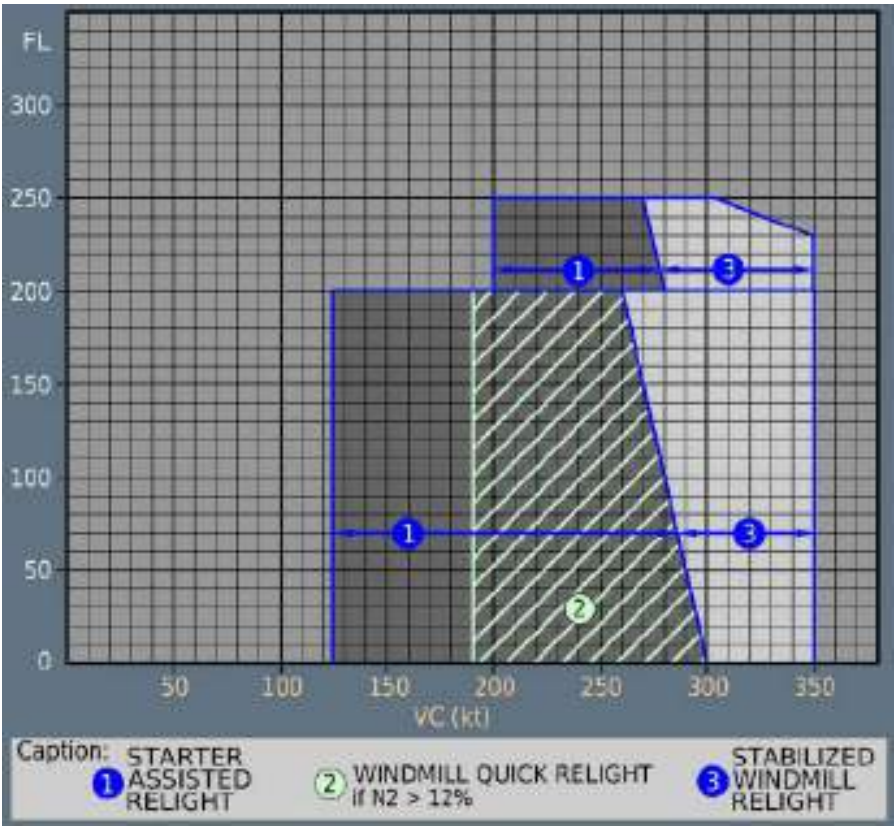
- The PF progressively adjusts engine thrust in two steps:
  - Step 1 : From idle to about 50 % N1 on brakes.
  - Step 2 : From both engines at similar N1 to takeoff thrust after brakes release.
- Other standard operative procedures apply for takeoff.

Ident.: PRO-SPO-45-B-00012734.0007001 / 14 MAY 12

ENGINE RESPONSE

In the case of only one operative pack configuration, due to the difference in N2 at idle between engines, the CFM56–5B/3 TI engine may accelerate from idle to high thrust faster than the CFM56–5B/P SAC engine when the aircraft is on ground or in flight in clean configuration. There is no significant effect on aircraft handling.

The difference in engine response disappears in flight when the slats are extended.



Note: *Depending on the FADEC standard, the flight crew may observe a different deceleration between the two engines (CFM56–5B/P engine is faster to decelerate) when the aircraft is above FL 100 and in unsymmetrical bleed configuration or with the APU BLEED ON.*

Ident.: PRO-SPO-45-B-00016162.0010001 / 02 MAY 17

ENGINE RELIGHT

For SAC-TI engine the maximum altitude for the engine relight envelope is reduced, compared with the SAC engine relight envelope. Therefore, in case of engine intermix, the flight crew must use the SAC-TI engine relight envelope below.

Engine Relight Envelope

GENERAL

Ident.: PRO-SPO-50-00020828.0001001 / 17 MAR 17
Applicable to: ALL

The A318/A319/A320/A321 aircraft systems are designed to comply with the design criteria of the EASA and FAA regulations (documents references provided in the AFM) for the RVSM capability. In addition, operators must obtain an operational approval from their national airworthiness authorities, in order to operate within the RVSM airspace. The EASA and FAA regulations (documents references provided in the AFM) also indicate the requirements for obtaining operational approval.

REQUIRED EQUIPMENTS/FUNCTIONS FOR RVSM

Ident.: PRO-SPO-50-00020955.0002001 / 17 MAR 17
Applicable to: ALL

RVSM regulations require the following equipment/functions in order to be operative:
- 2 ADRs + 2 DMCs
- 1 transponder
- 1 Autopilot function
- 1 FCU channel (for altitude target selection and OP CLB/OP DES mode engagement)
- 2 PFD functions (for altitude indication)
- 1 FWC (for altitude alert function).

RVSM NORMAL PROCEDURE

Ident.: PRO-SPO-50-00020830.0002001 / 17 MAR 17
Applicable to: ALL

For flights in RVSM airspace, the flight crew must apply the standard procedures, in addition to the following RVSM procedures.

FLIGHT PREPARATION

The flight crew must take into account the conditions that may affect operations in RVSM airspace, including:

RVSM APPROVAL.....CHECK

L2 *Verify that the aircraft is approved for RVSM operations.*

L1 WEATHER.....CHECK

L2 *Review the weather forecasted for the flight route. If severe turbulence is expected, this may affect the ability to maintain aircraft altitude.*

L1 REQUIRED EQUIPMENT FOR RVSM.....CHECK

L2 *Check that the required equipment is operative (MEL).*

The flight crew should review the maintenance logs and forms, in order to ensure that the equipment required for RVSM is satisfactory.

L1 ALTITUDES..... CHECK

L2 *Check that the difference between each altitude indication (in the QNH reference) displayed on PFDs and the airport elevation is less than 75 ft.*
Check that the difference between the two primary altitude indications on the PFDs is less than the tolerance specified in SOP. *Refer to PRO-NOR-SOP-06 Glareshield - EFIS Control Panel.*

L1 **IN FLIGHT**

BEFORE ENTERING RVSM AIRSPACE

REQUIRED EQUIPMENT FOR RVSM..... OPERATIVE

L2 *If any of the required equipment fails before the aircraft enters RVSM airspace, the flight crew must request new clearance, to avoid this airspace.*

L1 ALTITUDES..... CHECK

L2 *Check on the PFDs that the difference between altitude indications (in the standard baro setting) is less than the specified tolerance in the table below.*
If only two ADRs are operative, the altimeter indications on PFD and standby altimeter should be recorded. This information may be useful in case of subsequent PFD altitude discrepancy, or loss of both remaining ADRs.

L1

		Comparison of Altitude Indication (ft)		
Flight Level	**Speed or Mach Number**	**Difference between ADR1 and ADR2 (on PFDs)**	**Difference between ADR3 and ADR1/2 (on PFDs)**	**Difference between STBY ALTI and ADRs**
FL 50	250 kt	50 (15 m)	65 (20 m)	130 (40 m)
FL 100	250 kt	55 (17 m)	80 (24 m)	185 (56 m)
FL 200	300 kt	90 (27 m)	135 (41 m)	295 (90 m)
FL 300	M 0.78	130 (40 m)	195 (59 m)	390 (119 m)
FL 390	M 0.78	130 (40 m)	195 (59 m)	445 (136 m)

IN RVSM AIRSPACE

AP..... KEEP ENGAGED

L2 *Ensure that autopilot is engaged for cruise, and for flight level changes.*

L1 AP GUIDANCE..... MONITOR

L2 *During flight level transitions, do not exceed or go below the assigned flight level by more than 150 ft.*

L1 ● **Approximately every hour:**

ALTITUDES.....CHECK

L2 *Check that the difference between the altitude indications on PFDs is less than the specified tolerance. For more information, See table in "Before Entering RVSM airspace".*
Regular check of the flight deck instruments should be sufficient.

L1 **AT THE END OF THE FLIGHT**

ANY MALFUNCTIONS or DEVIATIONS.....REPORT

L2 *Report any malfunction of the systems that enable the aircraft to maintain altitude, including:*
- *Any malfunction or loss of required equipment*
- *Any deviation involving the functions that enable the aircraft to maintain altitude.*

RVSM ABNORMAL AND EMERGENCY PROCEDURE

Ident.: PRO-SPO-50-00020831.0002001 / 17 MAR 17
Applicable to: ALL

ATC.....NOTIFY

When the aircraft is in RVSM airspace, the flight crew must notify the ATC of the following situations, because they may affect the aircraft's ability to maintain the flight level:
- *The failure of both autopilots*
- *The loss of altimeter system redundancy (only one PFD indication remaining)*
- *An excessive discrepancy in altitude indications, and no way to identify the valid indication*
- *The failure of any other equipment, that affects the aircraft's ability to maintain flight level*
- *The encounter of greater than moderate turbulence.*

If the flight crew cannot notify the ATC or obtain the ATC clearance before deviating from the assigned flight level, they should follow the established contingency procedure and obtain the ATC clearance as soon as possible.

Intentionally left blank

GENERAL

Applicable to: ALL

Ident.: PRO-SPO-51-A-00015857.0001001 / 20 MAR 17

GENERAL

The Performance Based Navigation (PBN) concept implies that the aircraft follows the defined track with a requested navigation performance. The PBN includes RNAV and RNP operations. For RNAV and RNP operations, an operational approval from the airline's national authorities may be required.
The AFM provides regulatory compliances associated with PBN operations.

Ident.: PRO-SPO-51-A-00015859.0001001 / 09 SEP 14

RNAV/RNP CAPABILITY

Before the aircraft enters an RNAV/RNP airspace, RNAV/RNP capability is based on:
- The required RNAV/RNP equipment that is described in each RNAV/RNP section of the FCOM
- Navigation Accuracy HIGH displayed on the MCDU PROG page
- Any specific local requirements published in the Aeronautical Information Publication (AIP).

When the aircraft flies in RNAV/RNP airspace, RNAV/RNP capability is based on:
- Navigation Accuracy HIGH displayed on the MCDU PROG page
- Any specific local requirements published in the Aeronautical Information Publication (AIP).

RNAV 10 / RNP 10

Applicable to: ALL

Ident.: PRO-SPO-51-B-00015854.0001001 / 09 SEP 14

GENERAL

RNAV 10 operations correspond to RNP 10 operations.
In RNAV 10 airspace, the aircraft is expected to fly for a long period of time outside radio navaid coverage.

Ident.: PRO-SPO-51-B-00015855.0001001 / 09 SEP 14

REQUIRED RNAV 10 EQUIPMENT

The minimum navigation equipment required to enter RNAV 10 airspace is:
- Two FMGCs (or one FMGC and one BACK UP NAV ◁)
- Two MCDUs
- Two IRS

- Two NDs (the temporary display of ND information via the PFD/ND switch is permitted on one side)
- One GPS if the flight time outside radio navaid coverage is longer than:
  - 6.2 hr from the time of IRS ground alignment, or
  - 5.7 hr from the time of the last FM position update.

Ident.: PRO-SPO-51-B-00015863.0001001 / 11 APR 17

PROCEDURE

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGC that provides the correct position:**
  - GPS PRIMARY LOST ◁ on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.
- **If the GPS PRIMARY LOST ◁ message is displayed on both NDs/MCDUs, RNAV 10 operations can be continued:**
  - With no time restriction if radio navaids update is available
  - For 5.7 hr from the time of the last position update if radio navaids update is not available. After 5.7 hr, the navigation accuracy must be considered LOW regardless of the navigation accuracy that is displayed on the MCDU PROG page.
- **If one of the following MCDU or ECAM messages is displayed, the flight crew should crosscheck the position data using the POSITION MONITOR page, the IRS 1(2)(3) pages, and the GPS MONITOR page ◁ in order to identify which FMGC position is correct:**
  - FMS1/FMS2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION ◁
  - CHECK A/C POSITION ◁
  - NAV FM/GPS POS DISAGREE ◁

  The flight crew should resume navigation with the FMGC that provides the correct position.
- **If NAV ACCUR DOWNGRAD is displayed on both sides:**
  - As per design FMS REQ ACCUR is set by default; this default value (e.g. 2 NM in cruise, 1 NM in terminal area) is more restrictive than overflown airspace required navigation performance.
  - Any change on FMS REQ ACCUR to be in accordance with airspace requirement is at flight crew's discretion; and should be set back to default value when leaving intended airspace.

If NAV ACCUR DOWNGRAD remains displayed, the flight crew should inform ATC that the RNAV 10 capability is lost.

RNAV 5 / BRNAV

Applicable to: ALL

Ident.: PRO-SPO-51-C-00015851.0001001 / 20 MAR 17

GENERAL

RNAV 5 operations correspond to European BRNAV operations.

Ident.: PRO-SPO-51-C-00015852.0001001 / 06 JUL 17

REQUIRED RNAV 5 EQUIPMENT

The minimum navigation equipment required to enter RNAV 5 airspace is:
- One FMGC
- One MCDU
- One GPS or one DME receiver to update FM position
- Two NDs (the temporary display of ND information via the PFD/ND switch is permitted on one side)
- One IRS.

Ident.: PRO-SPO-51-C-00015864.0001001 / 11 APR 17

PROCEDURE

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGC that provides the correct position:**
  - GPS PRIMARY LOST ◁✻ on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.
- **If one of the following MCDU or ECAM messages is displayed, the flight crew should check the navigation accuracy with navaid raw data via the MCDU PROG page in order to identify which FMGC position is correct:**
  - GPS PRIMARY LOST ◁✻ on both NDs/MCDUs
  - FMS1/FMS2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION ◁✻
  - CHECK A/C POSITION ◁✻
  - NAV FM/GPS POS DISAGREE ◁✻

  The flight crew should resume navigation with the FMGC that provides the correct position.

- **If NAV ACCUR DOWNGRAD is displayed on both sides:**

  - As per design FMS REQ ACCUR is set by default; this default value (e.g. 2 NM in cruise, 1 NM in terminal area) is more restrictive than overflown airspace required navigation performance.
  - Any change on FMS REQ ACCUR to be in accordance with airspace requirement is at flight crew's discretion; and should be set back to default value when leaving intended airspace.

  If NAV ACCUR DOWNGRAD remains displayed, the flight crew should inform ATC that the RNAV 5 capability is lost.

RNAV 1 RNAV 2 / P-RNAV - TERMINAL RNAV

Applicable to: ALL

Ident.: PRO-SPO-51-D-00015848.0001001 / 20 MAR 17

GENERAL

RNAV 1(2) operations correspond to P-RNAV TERMINAL RNAV operations.
The AIP may specify that GPS equipment is required.

Ident.: PRO-SPO-51-D-00015849.0001001 / 06 JUL 17

REQUIRED RNAV 1(2) EQUIPMENT

The minimum navigation equipment required to enter RNAV1/RNAV2 airspace is:
- One FMGC
- One MCDU
- One GPS or one DME receiver to update the FM position
- Two IRS
- One FD in NAV mode
- Two NDs (the temporary display of ND information via the PFD/ND switch is permitted on one side).

Ident.: PRO-SPO-51-D-00015865.0001001 / 20 MAR 17

PROCEDURE

BEFORE ENTERING RNAV 1(2) AIRSPACE

The FMS navigation database provides the terminal procedure (RNAV SID, RNAV STAR, RNAV TRANSITION, etc.) of the flight plan. The flight crew must crosscheck the terminal procedure from the published charts with the FMS navigation database on the F-PLN page (waypoint sequences, tracks, distances, and altitude or speed constraints). The flight crew must

not modify the procedure that is provided by the navigation database, unless required by the ATC (DIR TO, radar vectoring, insertion of waypoints from the navigation database).

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGC that provides the correct position:**
  - GPS PRIMARY LOST ◁ on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.
- **If one of the following messages is displayed, the flight crew should check the navigation accuracy with navaid raw data via the MCDU PROG page in order to identify which FMGC position is correct:**
  - GPS PRIMARY LOST ◁ on both NDs/MCDUs
  - FMS1/FMS2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION ◁
  - CHECK A/C POSITION ◁
  - NAV FM/GPS POS DISAGREE ◁

  The flight crew should resume navigation with the FMGC that provides the correct position.
- **If NAV ACCUR DOWNGRAD is displayed on both sides:**

  The flight crew should inform the ATC that the RNAV 1(2) capability is lost.

RNP 4

Applicable to: ALL

Ident.: PRO-SPO-51-E-00015845.0001001 / 09 SEP 14

GENERAL

In this airspace, the aircraft is expected to fly for a long period of time outside radio navaid coverage.

Ident.: PRO-SPO-51-E-00015846.0001001 / 09 SEP 14

REQUIRED RNP 4 EQUIPMENT

The minimum navigation equipment required to enter RNP 4 airspace is:
- Two FMGCs (or one FMGC and one BACK UP NAV ◁)
- Two MCDUs
- Two IRS

- One GPS
- Two NDs (the temporary display of ND information via the PFD/ND switch is permitted on one side).

Ident.: PRO-SPO-51-E-00015866.0001001 / 11 APR 17

PROCEDURE

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGC that provides the correct position:**

  - GPS PRIMARY LOST on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.

- **If one of the following MCDU or ECAM messages is displayed, the flight crew should crosscheck the position data using the POSITION MONITOR page, the IRS 1(2)(3) pages, and the GPS MONITOR page in order to identify which FMGC position is correct:**

  - GPS PRIMARY LOST on both NDs/MCDUs
  - FMS1/FMS2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION
  - CHECK A/C POSITION
  - NAV FM/GPS POS DISAGREE

  The flight crew should resume navigation with the FMGC that provides the correct position.

- **If NAV ACCUR DOWNGRAD is displayed on both sides:**

  - As per design FMS REQ ACCUR is set by default; this default value (e.g. 2 NM in cruise, 1 NM in terminal area) is more restrictive than overflown airspace required navigation performance.
  - Any change on FMS REQ ACCUR to be in accordance with airspace requirement is at flight crew's discretion; and should be set back to default value when leaving intended airspace.

  If NAV ACCUR DOWNGRAD remains displayed, the flight crew should inform ATC that the RNAV 4 capability is lost.

RNP 2 IN OCEANIC AND REMOTE CONTINENTAL AREA

Applicable to: ALL

Ident.: PRO-SPO-51-I-00021541.0001001 / 20 MAR 17

GENERAL

In this airspace, the aircraft is expected to fly for a long period of time outside radio navaid coverage.

Ident.: PRO-SPO-51-I-00021542.0001001 / 20 MAR 17

REQUIRED RNP 2 IN OCEANIC AND REMOTE CONTINENTAL AREA EQUIPMENT

The minimum navigation equipment required to enter RNP 2 oceanic and remote continental airspace is:

- Two FMGCs (or one FMGC and one BACK UP NAV ⋖)
- Two MCDUs
- Two IRS
- One GPS
- Two NDs (the temporary display of ND information via the PFD/ND switch is permitted on one side).

Ident.: PRO-SPO-51-I-00021544.0001001 / 20 MAR 17

PROCEDURE

FLIGHT PREPARATION

RAIM/AIME availability should be confirmed for RNP 2 in oceanic and remote continental area operations.

Refer to PRO-NOR-SOP-02 GPS PRIMARY Availability (If Installed)

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGC that provides the correct position:**
  - GPS PRIMARY LOST on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.
- **If one of the following MCDU or ECAM messages is displayed, the flight crew should crosscheck the position data using the POSITION MONITOR page, the IRS 1(2)(3) pages, and the GPS MONITOR page in order to identify which FMGC position is correct:**
  - GPS PRIMARY LOST on both NDs/MCDUs
  - FMS1/FMS2 POS DIFF

- CHECK IRS 1(2)(3)/FM POSITION ◁✻
- CHECK A/C POSITION ◁✻
- NAV FM/GPS POS DISAGREE

The flight crew should resume navigation with the FMGC that provides the correct position.

- **If NAV ACCUR DOWNGRAD is displayed on both sides:**

  The flight crew should inform the ATC that the RNP 2 capability is lost.

RNP 2 IN DOMESTIC AREA

Applicable to: ALL

Ident.: PRO-SPO-51-J-00021545.0001001 / 20 MAR 17

REQUIRED RNP 2 IN DOMESTIC AREA EQUIPMENT

The minimum navigation equipment required to enter RNP 2 domestic airspace is:
- One FMGC
- One MCDU
- One GPS
- Two IRS
- Two NDs (the temporary display of ND information via the PFD/ND switch is permitted on one side).

Ident.: PRO-SPO-51-J-00021546.0001001 / 20 MAR 17

PROCEDURE

FLIGHT PREPARATION

RAIM/AIME availability should be confirmed for RNP 2 in domestic area operations.
Refer to PRO-NOR-SOP-02 GPS PRIMARY Availability (If Installed)

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGC that provides the correct position:**

  - GPS PRIMARY LOST ◁✻ on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.

- **If one of the following MCDU or ECAM messages is displayed, the flight crew should check the navigation accuracy with navaid raw data via the MCDU PROG page in order to identify which FMGC position is correct:**

  - GPS PRIMARY LOST ◁✻ on both NDs/MCDUs
  - FMS1/FMS2 POS DIFF

- CHECK IRS 1(2)(3)/FM POSITION ◁
- CHECK A/C POSITION ◁
- NAV FM/GPS POS DISAGREE ◁

The flight crew should resume navigation with the FMGC that provides the correct position.

- **If NAV ACCUR DOWNGRAD is displayed on both sides:**

  The flight crew should inform the ATC that the RNP 2 capability is lost.

RNP 1 / TERMINAL RNP 1- BASIC RNP 1

Applicable to: ALL

Ident.: PRO-SPO-51-F-00015842.0001001 / 20 MAR 17

GENERAL

RNP 1 operations correspond to RNP 1 Terminal operations.

Ident.: PRO-SPO-51-F-00015843.0001001 / 17 MAR 16

REQUIRED RNP 1 EQUIPMENT

The minimum navigation equipment required to enter RNP 1 airspace is:
- One FMGC
- One MCDU
- One GPS
- Two IRS
- One FD in NAV mode
- Two NDs (the temporary display of ND information via the PFD/ND switch is permitted on one side).

Ident.: PRO-SPO-51-F-00015867.0001001 / 20 MAR 17

PROCEDURE

FLIGHT PREPARATION

RAIM/AIME availability should be confirmed for RNP 1 operations.
Refer to PRO-NOR-SOP-02 GPS PRIMARY Availability (If Installed)

BEFORE ENTERING RNP 1 AIRSPACE

The FMS navigation database provides the terminal procedure (RNAV SID, RNAV STAR, RNAV TRANSITION, etc.) of the flight plan. The flight crew must check the terminal procedure from the published charts with the FMS navigation database on the F-PLN page (waypoint sequences, tracks, distances, and altitude or speed constraints). The flight crew must not

modify the procedure that is provided by the navigation database, unless required by the ATC (DIR TO, radar vectoring, insertion of waypoints from the navigation database).

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGC that provides the correct position:**
  - GPS PRIMARY LOST ◁✻ on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.
- **If one of the following MCDU or ECAM messages is displayed, the flight crew should check the navigation accuracy with navaid raw data via the MCDU PROG page in order to identify which FMGC position is correct:**
  - GPS PRIMARY LOST ◁✻ on both NDs/MCDUs
  - FMS1/FMS2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION ◁✻
  - CHECK A/C POSITION ◁✻
  - NAV FM/GPS POS DISAGREE ◁✻

  The flight crew should resume navigation with the FMGC that provides the correct position.
- **If NAV ACCUR DOWNGRAD is displayed on both sides:**

  The flight crew should inform the ATC that the RNP 1 capability is lost.

RNP APCH / RNAV(GNSS)

Applicable to: ALL

Ident.: PRO-SPO-51-G-00015839.0001001 / 20 MAR 17

GENERAL

RNP APCH operations correspond to RNAV(GNSS) or RNAV(GPS) operations.

Ident.: PRO-SPO-51-G-00015840.0001001 / 11 JUL 17

REQUIRED RNP APCH EQUIPMENT

The minimum equipment required to start RNP APCH operations is:
- One FMGC
- One GPS
- Two IRS
- One MCDU
- One FD
- One PFD on the PF side

- Two NDs (the temporary display of ND information via the PFD/ND switch is permitted on PM side)
- Two FCU channels.

Ident.: PRO-SPO-51-G-00015868.0001001 / 05 JUN 18

PROCEDURE

Refer to PRO-NOR-SOP-18-C Approach using FINAL APP Guidance - General
Refer to PRO-NOR-SOP-18-C Approach using FPA Guidance - General

Intentionally left blank

GENERAL

Ident.: PRO-SPO-60-00002094.0001001 / 03 JAN 11
Applicable to: MSN 02405-02443, 02482, 02649-02670, 02804-02914, 05158

A standard runway is 45 m wide. Operations on runways less than 45 m wide require authorization from the Airworthiness Authorities.

GENERAL

Ident.: PRO-SPO-60-00002094.0002001 / 03 JAN 11
1 **Applicable to: MSN 01767-02388, 02457, 02584-02626, 02712-02737, 03071-05155, 05190-09063**

This chapter gives the limitations, procedures and performance for operations from/to runways with a width below 45 m .
This chapter does not constitute an operational approval to operate on narrow runways.
Such authorization must be obtained by the operator from the appropriate authorities.

LIMITATIONS

Ident.: PRO-SPO-60-00006122.0002001 / 21 MAR 17
2 **Applicable to: MSN 01767-02388, 02457, 02584-02626, 02712-02737, 03071-05155, 05190-09063**

Minimum runway width.....30 m

The dispatch from/to narrow runways is not allowed in case of :
- Nose wheel steering inoperative
- One brake or more inoperative

Autoland is not allowed.

PROCEDURES

Ident.: PRO-SPO-60-00006123.0006001 / 12 SEP 17
3 **Applicable to: MSN 06720-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

Diversion to a 45 m wide runway is recommended in case of :
- Rudder jam
- Rudder pedal jam
- Yaw damper system fault
- Rudder Travel Limit system fault
- All failures leading to the loss of the nose wheel steering (HYD Yellow system loss, double hydraulic failure, double BSCU fault, double LGCIU fault)

Maximum demonstrated crosswind for takeoff and landing:

Dry runway.....38 kt (gust included) for takeoff and landing
Wet runway.....33 kt (gust included) for takeoff and landing

Contaminated runway..... 10 kt (gust included) for takeoff and landing

Note: These maximum demonstrated crosswind values are based on the assumption that the crew have been trained accordingly.

Operations on icy runways have not been demonstrated.

PROCEDURES

Ident.: PRO-SPO-60-00006123.0002001 / 21 MAR 17
Applicable to: MSN 01767-02388

Diversion to a 45 m wide runway is recommended in case of :
- Rudder jam
- Rudder pedal jam
- Yaw damper system fault
- Rudder Travel Limit system fault
- All failures leading to the loss of the nose wheel steering (HYD Green system loss, double hydraulic failure, double BSCU fault, double LGCIU fault)

Maximum demonstrated crosswind for takeoff and landing:

Dry runway.....38 kt (gust included) for takeoff and landing
Wet runway.....33 kt (gust included) for takeoff and landing
Contaminated runway..... 10 kt (gust included) for takeoff and landing

Note: These maximum demonstrated crosswind values are based on the assumption that the crew have been trained accordingly.

Operations on icy runways have not been demonstrated.

PROCEDURES

Ident.: PRO-SPO-60-00006123.0003001 / 21 MAR 17
4 **Applicable to: MSN 02457, 02584-02626, 02712-02737, 03071-05155, 05190-06336, 08557, 08587, 08655, 08710, 08768, 09063**

Diversion to a 45 m wide runway is recommended in case of :
- Rudder jam
- Rudder pedal jam
- Yaw damper system fault
- Rudder Travel Limit system fault
- All failures leading to the loss of the nose wheel steering (HYD Yellow system loss, double hydraulic failure, double BSCU fault, double LGCIU fault)

Maximum demonstrated crosswind for takeoff and landing:

Dry runway.....38 kt (gust included) for takeoff and landing
Wet runway.....33 kt (gust included) for takeoff and landing

Contaminated runway..... 10 kt (gust included) for takeoff and landing

Note: These maximum demonstrated crosswind values are based on the assumption that the crew have been trained accordingly.

Operations on icy runways have not been demonstrated.

PERFORMANCE

Ident.: PRO-SPO-60-00006124.0001001 / 23 JUN 15

[5] **Applicable to: MSN 01767-02388, 02457, 02584-02626, 02712-02737, 03071-05155, 05190-09063**

For runways with a width above or equal to 40 m ., the basic takeoff performance remains unchanged.
For runways with a width below 40 m , the VMCG must be increased by the values indicated in the following table :

Runway Width	30 m	35 m	40 m
∆ VMCG(kt)	+ 2.5	+ 1.5	+ 0

No correction is required, when takeoff performance is determined by using the applicable approved data.
The minimum V1 values, published in the *Refer to PER-TOF-TOD-25-10 SPEEDS LIMITED BY VMCG/VMCA*, must be increased by 3 kt .
When using the takeoff performance for contaminated runways *Refer to PER-TOF-CTA-10 GENERAL*, the resulting V1 must be crosschecked with the corrected minimum V1.
Further decrease the takeoff weight by 3 t per knot increase in V1.

Intentionally left blank

GENERAL

Ident.: PRO-SPO-63-00018878.0003001 / 05 JUN 18
Applicable to: MSN 02443, 02670, 02908-02914, 04399, 04438

At LEH (VILH) airport, the mean runway slope is 2.9 %.

This chapter gives the limitations, procedures and performance for operations from/to this runway.

Note: This chapter must be combined with the "High Altitude operations" procedures. Refer to PRO-NOR-SUP-MISC-A Operation at or Above 9 200 ft..

This chapter does not constitute an operational approval to operate on this runway. Such authorization must be obtained by the operator from the appropriate authorities.

LIMITATIONS

Ident.: PRO-SPO-63-00018879.0003001 / 21 MAR 17
Applicable to: MSN 02443, 02670, 02908-02914, 04399, 04438

At LEH airport, the mean runway slope is 2.9 %.
Takeoff must be performed downhill.
The relative slope between approach slope and runway slope is limited to less than 4.5 °.
Landing must be performed uphill.
Autoland is not allowed.

PROCEDURES

Ident.: PRO-SPO-63-00018880.0003001 / 21 MAR 17
Applicable to: MSN 02443, 02670, 02908-02914, 04399, 04438

Minimum approach speed is VLS +5 kt

Note: The flare height should be increased for landing at high altitude airports particularly with high approach speeds or for approaches with increased glide slope or to uphill sloping runways

PERFORMANCE

Ident.: PRO-SPO-63-00018881.0003001 / 21 MAR 17
Applicable to: MSN 02443, 02670, 02908-02914, 04399, 04438

The Performance Engineering Program/AFM_OCTO Flight Manual modules at the approved revision given in AFM (*Refer to AFM/AFM/PERF/OCTO Performance Database*) have to be used for takeoff and landing.
The mean runway slope must be entered for performance determination.
Landing distance determination does not require any speed increment.

Minimum approach climb gradient is 3 %.

Minimum landing climb gradient is 4.1 %.

OVERVIEW

Ident.: PRO-SPO-85-00020844.0001001 / 17 MAR 17
Applicable to: ALL

The Precision Runway Monitor (PRM) system enables simultaneous close parallel ILS approaches. The air traffic controllers use the PRM system to monitor the aircraft position. If necessary, the ATC orders a break out, turn and climb or descent.

To perform PRM operations:
- The air traffic controllers and the flight crew must satisfy specific training requirements
- The ATC and the aircraft equipment must comply with specific requirements.

BREAK OUT TURN AND CLIMB PROCEDURE

Ident.: PRO-SPO-85-00020845.0001001 / 17 MAR 17
Applicable to: ALL

Simultaneously:

AP..... OFF
BREAK OUT LEFT(RIGHT), HDG___, ALT___..... ANNOUNCE
THRUST LEVERS.....TOGA, and back to CL

L2 *The SRS GA and the GA TRK modes engage. The THR CLB mode engages.*
The speed is managed. The speed target is the aircraft speed at SRS GA engagement.
The FMS GO-AROUND phase becomes active. Therefore, the FMS reinserts the approach.

L1 TURN LEFT(RIGHT) AND CLIMB

L2 *As the situation is urgent, the flight crew should temporarily disregard the FD orders.*

Then

L1 HDG___..... TURN AND PULL

L2 *The GA TRK mode disengages, and the HDG mode engages.*

L1 ALT___.....TURN AND PULL

L2 *The SRS GA mode disengages, and the OP CLB mode engages. The speed target becomes the FMS speed target of the CLIMB phase.*

L1 SPEED..... PULL AND ADJUST

L2 *For the initial break out procedure, adjust the speed (e.g. 160 kt), in order to avoid a significant acceleration, and an increase in workload.*

L1 ● **When established on the break out path:**
AP.....ON

L2 *Before engaging the AP, ensure that the FD bar orders correspond to the aircraft current path.*

L1 SPEED.....SELECT AS RQRD
FLAPS.....AS RQRD
GEAR.....AS RQRD
TCAS MODE SEL.....TA/RA AS RQRD

BREAK OUT TURN AND DESCENT PROCEDURE

Ident.: PRO-SPO-85-00020846.0001001 / 17 MAR 17
Applicable to: ALL

Simultaneously:

AP..... OFF
TURN LEFT(RIGHT) AND MAINTAIN RATE OF DESCENT
BREAK OUT LEFT(RIGHT), HDG___, ALT___..... ANNOUNCE

L2 *As the situation is urgent, the flight crew should temporarily disregard the FD orders.*

Then

L1 HDG___..... TURN AND PULL

L2 *The HDG mode engages. The vertical mode reverts to the V/S mode. The vertical speed target is the aircraft vertical speed at V/S engagement.*

L1 ALT___.....TURN AND PULL

L2 *This action defines an altitude target. The OP DES mode and the THR IDLE mode engage. The speed target does not change.*

L1 V/S.....MONITOR

CAUTION	*Depending on the speed target, the vertical speed may become excessive. If the rate of descent exceeds 1 000 ft/min, engage the V/S mode and limit the rate of descent to 1 000 ft/min.*

- **When established on the break out path:**
  AP.....ON

L2 *Before engaging the AP, ensure that the FD bar orders correspond to the aircraft current path.*

L1 - **When cleared by ATC:**
  ALT___..... TURN

L2 *Select an altitude target for go-around, in accordance with the ATC clearance.*

L1 THRUST LEVERS..... TOGA, and back to CL

L2 *The SRS GA and the GA TRK modes engage. The THR CLB mode engages.*
The speed is managed. The speed target is the aircraft speed at SRS GA engagement.
The FMS GO-AROUND phase becomes active.

L1 HDG___.....PULL

L2 *The GA TRK mode disengages, and the HDG mode engages. The SRS GA mode remains engaged, until ALT* engagement.*

L1 SPEED.....SELECT AS RQRD
FLAPS.....AS RQRD
GEAR.....AS RQRD
TCAS MODE SEL.....TA/RA AS RQRD

Note: For landing with a tailwind greater than 10 kt, FLAPS FULL is recommended.

Ident.: LIM-AG-OPS-ARPT_WIND-00020166.0001001 / 04 JUL 17

Applicable to: ALL

PASSENGER AND CARGO DOORS OPERATION

The following are the wind limitations for passenger and cargo doors operation:

- The maximum wind for passenger door operation is 65 kt
- The maximum wind for FWD and AFT cargo door operation is 40 kt (or 50 kt, if the aircraft nose is into the wind, or if the FWD and AFT cargo doors are on the leeward side)
- The FWD and AFT cargo doors must be closed before the wind speed exceeds 65 kt.

Ident.: LIM-AG-OPS-ARPT_WIND-00020046.0003001 / 05 JUN 18

Applicable to: ALL

MAXIMUM RECOMMENDED CROSSWIND ON WET AND CONTAMINATED RUNWAYS

Runway Surface Conditions		Maximum Crosswind for Takeoff (Gust included)	Maximum Crosswind for Landing (Gust included)
Runway State or / and Runway Contaminant	**ESF(1) or PIREP(2)**		
Damp **Wet** Up to 3 mm (1/8") of water **Slush** Up to 3 mm (1/8") **Dry snow** Up to 3 mm (1/8") **Wet snow** Up to 3 mm (1/8") **Frost**	**Good**	38 kt	38 kt
Compacted snow OAT at or below -15 °C	**Good to Medium**	29 kt	29 kt
Dry snow More than 3 mm (1/8"), up to 100 mm (4") **Wet snow** More than 3 mm (1/8"), up to 30 mm (6/5") **Compacted snow** OAT above -15 °C **Dry snow over compacted snow** **Wet snow over compacted snow** **Slippery when wet**	**Medium**	25 kt	25 kt

Continued on the following page

Continued from the previous page

Runway Surface Conditions		Maximum Crosswind for Takeoff (Gust included)	Maximum Crosswind for Landing (Gust included)
Runway State or / and Runway Contaminant	**ESF(1) or PIREP(2)**		
Water More than 3 mm (1/8"), up to 13 mm (1/2") **Slush** More than 3 mm (1/8"), up to 13 mm (1/2")	**Medium to Poor**	20 kt	20 kt
Ice (cold & dry)	**Poor**	15 kt	15 kt

(1) *ESF: Estimated Surface Friction*

(2) *PIREP: Pilot Report of Braking Action*

Note: The maximum crosswind values given in the above table are recommended values based on computations.

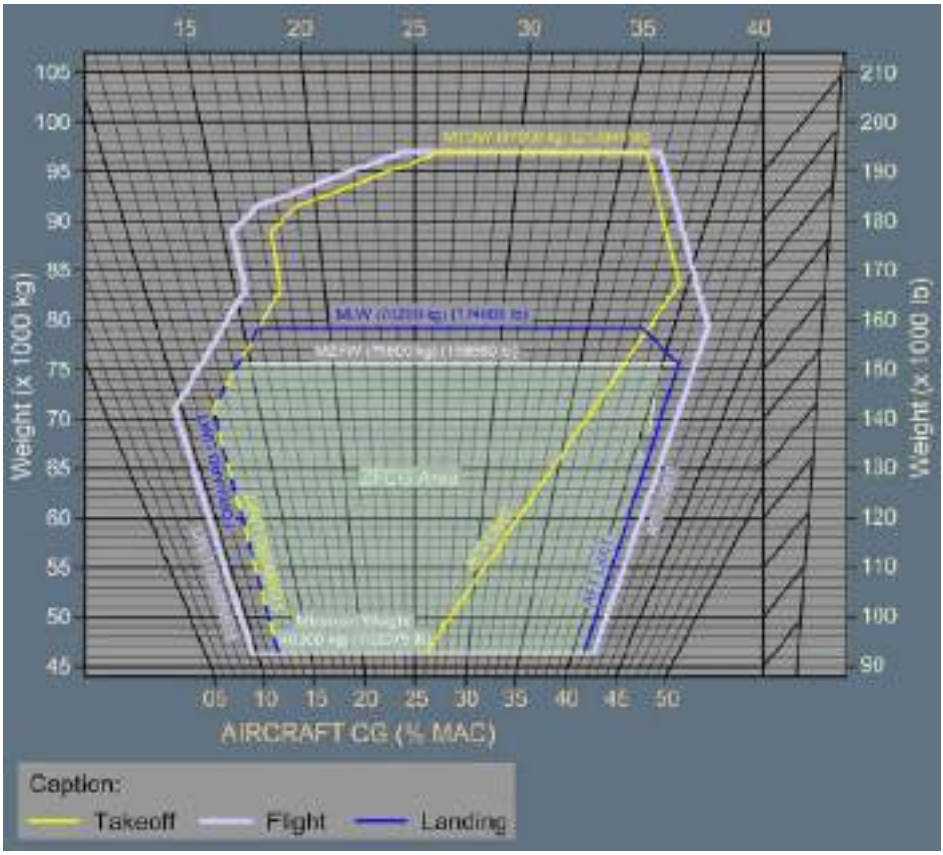
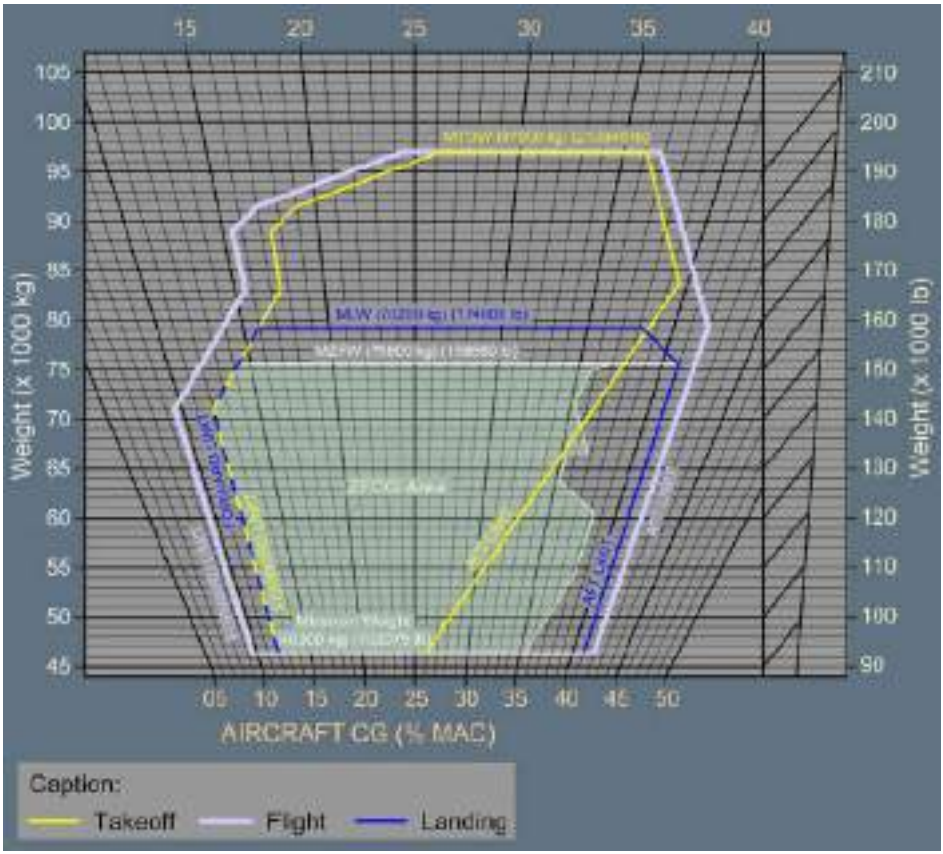
CENTER OF GRAVITY LIMITS WITH UP TO 3 ACTS INSTALLATION



Ident.: LIM-AG-WGHT-00022520.0005001 / 04 SEP 18

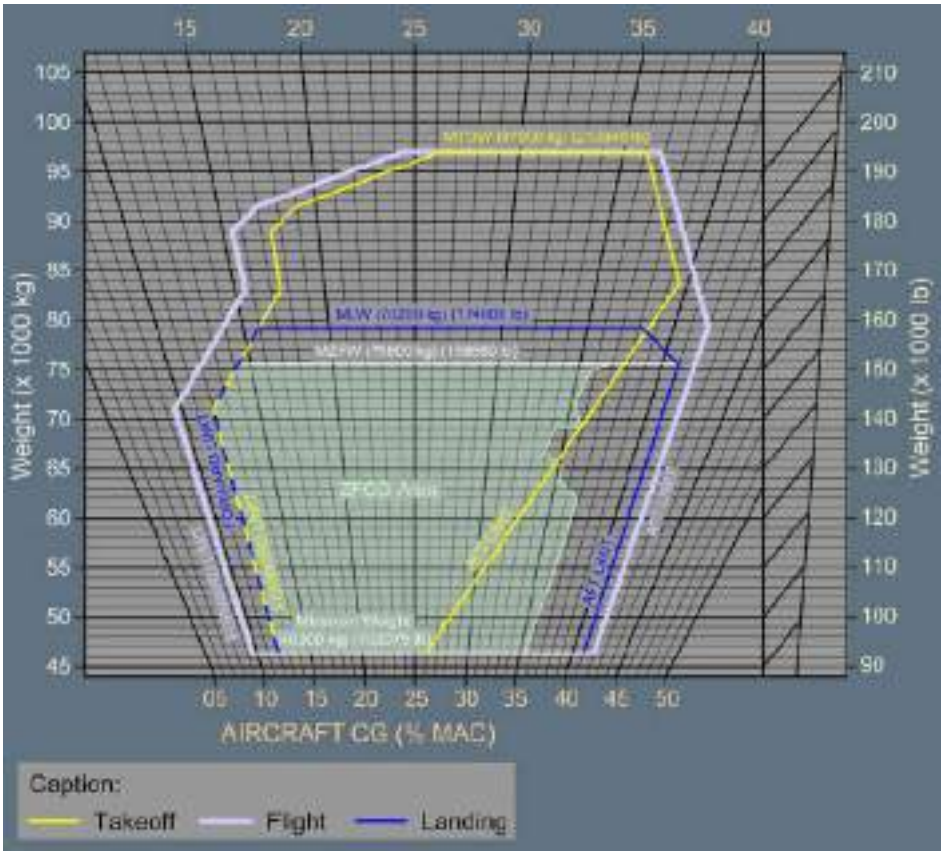
[4] **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

The CG envelope provides the CG limits for the highest certified MTOW, MLW and MZFW. The CG limits of the aircraft must be restricted according to the aircraft MTOW, MLW and MZFW given in the Weight Limitations chapter.
The ZFCG at dispatch must be within the ZFCG area.



1. The following CG envelope is valid for:
   - Aircraft with only one ACT (AFT1 ACT) installed and refueled.
   - Aircraft with two or three ACTs installed, but only one ACT (AFT1 ACT) refueled.

CG Envelope - One ACT refueled



2. The following CG envelope is valid for:
   - Aircraft with only two ACTs (AFT1 ACT and AFT2 ACT) installed and two ACTs refueled.
   - Aircraft with three ACTs installed, but only two ACTs (AFT1 ACT and AFT2 ACT) refueled.

CG Envelope - Two ACTs refueled

3. The following CG envelope is valid for:
   - Aircraft with three ACTs (FWD ACT, AFT1 ACT and AFT2 ACT) installed and three ACTs refueled.

CG Envelope - Three ACTs refueled

- CG limits are given in percentage of the reference chord length aft of the leading edge.
- The reference chord length is 4.193 m (13.76 ft). It is 20.58 m (67.51 ft) aft of the aircraft nose.

LIMITATIONS

AIR BLEED/COND/PRESS/VENT

Intentionally left blank

General....A
APU Bleed Use with HP Air Start Unit....B
Avionics Ventilation....C
Cabin Pressure....D
Packs Use with LP Air Conditioning Unit....E

Intentionally left blank

GENERAL

Ident.: LIM-AIR-00020807.0001001 / 17 MAR 17
Applicable to: ALL

With passengers on board, it is not recommended to exceed 20 min without air conditioning supply. The lack of fresh air supply will significantly reduce the cabin's air quality.

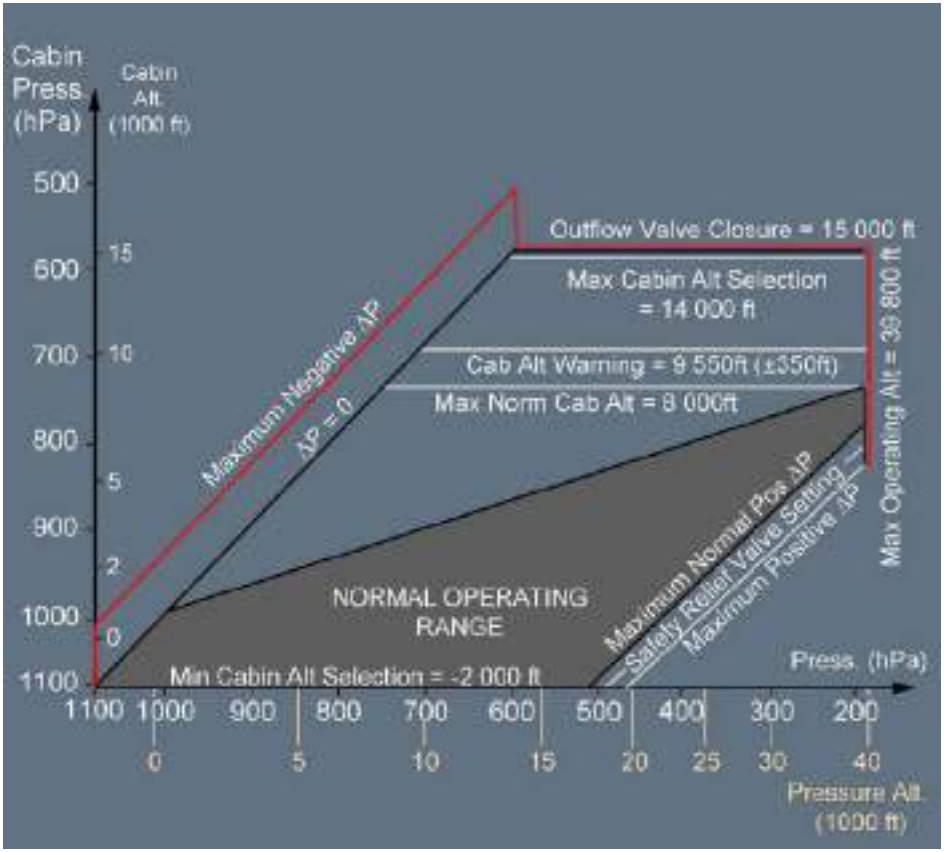
APU BLEED USE WITH HP AIR START UNIT

Ident.: LIM-AIR-00020084.0001001 / 17 MAR 17
Applicable to: ALL

The flight crew must not use bleed air from the APU BLEED and from the HP Air Start Unit at the same time, to prevent any adverse effect on the Bleed Air System.

AVIONICS VENTILATION

Ident.: LIM-AIR-00020086.0001001 / 17 MAR 17
Applicable to: ALL



During ground operations and depending on the Outside Air Temperature (OAT), the flight crew must limit the time that the aircraft electric power supply is used, in normal avionics ventilation system configuration, as follows:

OAT ≤ 49 °C	No limitation
49 °C < OAT ≤ 55 °C	2 h
55 °C < OAT ≤ 60 °C	1 h
60 °C < OAT ≤ 64 °C	0.5 h

CABIN PRESSURE

Ident.: LIM-AIR-00020085.0003001 / 17 MAR 17
Applicable to: ALL

Maximum positive differential pressure..... 9.0 PSI
Maximum negative differential pressure.....-1.0 PSI
Safety relief valve setting..... 8.6 PSI

Note: *Maximum differential pressure (Δp) and safety valve setting tolerance = ± 7 hPa (0.1 PSI).*

PACKS USE WITH LP AIR CONDITIONING UNIT

Ident.: LIM-AIR-00020083.0001001 / 17 MAR 17
Applicable to: ALL

The flight crew must not use conditioned air from the packs and from the LP Air Conditioning Unit at the same time, to prevent any adverse effect on the Air Conditioning system.

5 In all other phases	900 ft AGL
The AP or FD in OP DES or DES mode can be used in approach. However, its use is only permitted if the FCU selected altitude is set to, or above, the higher of the two: MDA/MDH or 900 ft AGL.	

FLIGHT MANAGEMENT FUNCTION

Applicable to: ALL

Ident.: LIM-AFS-10-20-00020069.0001001 / 27 FEB 18

FMGS lateral and vertical navigation is certified for:
- After takeoff, en route, and terminal area operations
- Navigation within RNAV/RNP airspace
- Instrument approach procedures (except ILS, LOC, LOC B/C, LDA, SDF, GLS ◁, MLS ◁ and FLS ◁ final approaches)
- Missed approach procedures.

The FLS ◁ function is certified for:
- RNAV, RNAV (GNSS), GPS, VOR, VOR/DME, NDB, NDB/DME instrument approach procedures, using FMS navigation for lateral and vertical navigation
- LOC, ILS (GS out), or LOC B/C instrument approaches, using FMS navigation for vertical navigation, associated with LOC or LOC B/C for lateral navigation.

Approval of the FMGS is based on the assumption that the navigation database is validated for intended use.
Obstacle clearance and adherence to airspace constraints remains a flight crew responsibility.
Fuel, time predictions/performance information is provided for advisory purposes only.

Ident.: LIM-AFS-10-20-00020070.0002001 / 17 MAR 17

NAVIGATION PERFORMANCE

The navigation accuracy depends on:
- IRS drift, or
- One of the following:
  - Radio navaid availability, or
  - Elapsed time since last computation of radio navaid position.

RNP accuracy with GPS PRIMARY ◁ is:

	With AP ON (1)	With AP OFF and FD ON (1)	With AP OFF and FD OFF
En route	1 NM	1 NM	1.1 NM
In terminal area	0.5 NM	0.51 NM	0.51 NM
In approach	0.3 NM	0.3 NM	0.3 NM with F-LOC ◁ deviation Not authorized without F-LOC ◁ deviation

(1) - *In NAV (all phases), or*
- *In F-LOC ◁ (approach phase)*

Ident.: LIM-AFS-10-20-00020389.0001001 / 04 MAY 18

DEGRADED SITUATION

If GPS PRIMARY LOST ◁ is displayed on the ND and MCDU, the navigation accuracy remains sufficient for RNP operations provided that, the RNP value is checked or entered on the MCDU and HIGH ACCURACY is displayed.

USE OF NAV MODE

Applicable to: ALL

Ident.: LIM-AFS-10-30-00020334.0001001 / 17 MAR 17

AFTER TAKEOFF

NAV mode may be used after takeoff provided that:
- GPS PRIMARY ◁ is available, or
- The flight crew checked the FMGS takeoff updating.

Ident.: LIM-AFS-10-30-00020335.0001001 / 17 MAR 17

IN TERMINAL AREA

NAV mode may be used in terminal area provided that:
- GPS PRIMARY ◁ is available, or
- the appropriate RNP is checked or entered on the MCDU, and HIGH accuracy is displayed, or
- FMS navigation is crosschecked with navaid raw data.

Ident.: LIM-AFS-10-30-00020336.0001001 / 17 MAR 17

APPROACH BASED ON RADIO NAVAIDS

A navaids approach may be performed in NAV, APP NAV or FINAL APP, with AP or FD engaged, provided that:
- If GPS PRIMARY ◁ is available, the reference navaid may be unserviceable, or the airborne radio equipment may be inoperative, or not installed, provided that an operational approval is obtained
- If GPS PRIMARY is not available, the reference navaid and the corresponding airborne radio equipment must be serviceable, tuned and monitored during the approach.

Note: *FLS ◁ is the recommended managed lateral and vertical guidance mode for radio navaids approach.*

Ident.: LIM-AFS-10-30-00020337.0001001 / 17 MAR 17

RNAV APPROACH

An RNAV(RNP) approach may be performed, with GPS PRIMARY not available, only if the radio navaid coverage supports the RNP value and HIGH accuracy is displayed on the MCDU with the specified RNP, and an operational approval is obtained.
An RNAV(GNSS) approach may be performed provided that GPS PRIMARY ◁ is available.
Refer to Guidance Modes per Approach Types

Note: *FLS ◁ is the recommended managed lateral and vertical guidance mode for RNAV approach.*

USE OF FLS

Ident.: LIM-AFS-10-00020808.0001001 / 17 MAR 17
Applicable to: ALL

APPROACH BASED ON RADIO NAVAIDS

A navaids approach may be flown with the FLS provided that:

- F-APP capability is displayed on FMA
  In this case, the reference navaids may be unserviceable, or the airborne radio equipment may be inoperative, or not installed, provided that an operational approval is obtained.
- F-APP + RAW capability is displayed on FMA.
  In this case, the reference navaids and the corresponding airborne radio equipment must be serviceable, tuned and monitored during the approach.

An ILS (G/S out), LOC, or LOC-B/C approach may be flown with the lateral LOC (LOC-B/C) mode and with the F-G/S mode of FLS function provided that:

- F-APP capability is displayed on FMA
  In this case, the reference navaids may be unserviceable, or the airborne radio equipment may be inoperative, or not installed, provided that an operational approval is obtained.
- F-APP + RAW capability is displayed on FMA.
  In this case, the reference navaids and the corresponding airborne radio equipment must be serviceable, tuned and monitored during the approach.

RNAV(GNSS) APPROACH

An RNAV(GNSS) approach with LNAV minimum may be flown with the FLS provided that the F-APP capability is displayed on FMA.
An RNAV(GNSS)approach with LNAV/VNAV minimum must be flown with the FLS provided that the F-APP capability is displayed on FMA.

NON-PRECISION APPROACHES WITH ENGINE-OUT

Ident.: LIM-AFS-10-00006519.0001001 / 09 FEB 11
Applicable to: MSN 02388, 02443, 02914, 03264-03330

If one engine is inoperative, it is not permitted to use the autopilot to perform NPAs in the following modes: FINAL APP, NAV V/S, NAV/FPA.
Only FD use is permitted.

NAVIGATION DATABASE VALIDATION

Applicable to: ALL

Ident.: LIM-AFS-10-40-00021656.0002001 / 08 AUG 17

RNAV(GNSS) APPROACHES AND APPROACHES BASED ON VOR/NDB

To fly an approach in lateral managed mode or lateral and vertical managed mode, the approach stored in the Navigation database must be either:

- Produced by an approved supplier compliant with ED76/DO200A requirements, or
- Validated and approved by the Operator.

Note: *RNAV(GNSS) approaches lateral trajectories are geometrically based on waypoints coordinates. Thus, validating waypoints coordinate ensure no coding error on the approach and correct lateral trajectory. Observed lateral track degree of difference between MCDU F-PLN page display and charts may come from inconsistency between FMS MagVar and charted MagVar, which has no effect on lateral trajectory.*

Intentionally left blank

ILS CATEGORY II

Ident.: LIM-AFS-20-00020136.0001001 / 18 SEP 18
Applicable to: ALL

Minimum decision height.....100 ft
At least one autopilot must be engaged in APPR mode, and CAT 2 or CAT 3 SINGLE or CAT 3 DUAL must be displayed on the FMA.
For manual landing, AP should be disconnected no later than 80 ft AGL.

SPECIAL AUTHORIZATION CAT II (SA CAT II)

Ident.: LIM-AFS-20-00020138.0001001 / 18 SEP 18
Applicable to: ALL

Minimum decision height.....100 ft
At least one autopilot must be engaged in APPR mode, and CAT 2 or CAT 3 SINGLE or CAT 3 DUAL must be displayed on the FMA.
With HUD ◁, the flight crew must use the HUD to monitor the approach and perform an automatic landing or a manual landing. If the flight crew performs an automatic approach without automatic landing, the autopilot must be disengaged no later than at 80 ft AGL.
Without HUD, the flight crew must perform an automatic landing.

OTHER THAN STANDARD CAT II (OTS CAT II)

Ident.: LIM-AFS-20-00020139.0001001 / 18 SEP 18
Applicable to: ALL

Minimum decision height.....100 ft
At least one autopilot must be engaged in APPR mode, and CAT 2 or CAT 3 SINGLE or CAT 3 DUAL must be displayed on the FMA.
With HUD ◁, the flight crew must use the HUD to monitor the approach and perform an automatic landing or a manual landing. If the flight crew performs an automatic approach without automatic landing, the autopilot must be disengaged no later than at 80 ft AGL.
Without HUD, the flight crew must perform an automatic landing.

ILS CATEGORY III FAIL PASSIVE (SINGLE)

Ident.: LIM-AFS-20-00020140.0001001 / 18 SEP 18
Applicable to: ALL

Minimum decision height.....50 ft
A/THR must be used in selected or managed speed.
At least one autopilot must be engaged in APPR mode, and CAT 3 SINGLE or CAT 3 DUAL must be displayed on the FMA.

ILS CATEGORY III FAIL OPERATIONAL (DUAL)

Ident.: LIM-AFS-20-00020141.0001001 / 17 MAR 17

1 **Applicable to: MSN 06720-09063**

Alert height.....100 ft AGL
A/THR must be used in selected or managed speed.
Both autopilots must be engaged in APPR mode, and CAT 3 DUAL must be displayed on the FMA.

- **CAT III without DH:**
  Minimum Runway Visual Range.....75 m

ILS CATEGORY III FAIL OPERATIONAL (DUAL)

Ident.: LIM-AFS-20-00020141.0008001 / 18 SEP 18

Applicable to: MSN 01767-01920, 02388, 02584, 02712, 03138, 03750, 04294, 04314, 04393-04438, 04510

Alert height..... 100 ft
A/THR must be used in selected or managed speed.
Both autopilots must be engaged in APPR mode, and CAT 3 DUAL must be displayed on the FMA.

- **CAT III with DH:**
  Minimum Decision Height.....20 ft
- **CAT III without DH:**
  Minimum Runway Visual Range.....75 m

ILS CATEGORY III FAIL OPERATIONAL (DUAL)

Ident.: LIM-AFS-20-00020141.0004001 / 18 SEP 18

2 **Applicable to: MSN 01957-02359, 02405-02482, 02609-02670, 02737-03071, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-05411**

Alert height..... 100 ft
A/THR must be used in selected or managed speed.
Both autopilots must be engaged in APPR mode, and CAT 3 DUAL must be displayed on the FMA.

- **CAT III with DH:**
  Minimum Decision Height.....25 ft
- **CAT III without DH:**
  Minimum Runway Visual Range.....75 m

ILS CATEGORY III FAIL OPERATIONAL (DUAL)

Ident.: LIM-AFS-20-00020141.0002001 / 18 SEP 18

Applicable to: MSN 05437-06336

Alert height..... 100 ft
A/THR must be used in selected or managed speed.

Both autopilots must be engaged in APPR mode, and CAT 3 DUAL must be displayed on the FMA.

- **CAT III with DH:**
  Minimum Decision Height..... 22 ft
- **CAT III without DH:**
  Minimum Runway Visual Range.....75 m

ENGINE-OUT

Ident.: LIM-AFS-20-00020142.0001001 / 17 MAR 17

3 **Applicable to: MSN 01767-06336**

CAT II and CAT III fail passive autoland are only approved in configuration FULL, and if engine-out procedures are completed before reaching 1 000 ft in approach.

ENGINE-OUT

Ident.: LIM-AFS-20-00020142.0003001 / 17 MAR 17

4 **Applicable to: MSN 06720-09063**

CAT II and CAT III fail passive autoland are only approved in configuration 3 and FULL, and if engine-out procedures are completed before reaching 1 000 ft in approach.

MAXIMUM WIND CONDITIONS FOR ILS/MLS ⋖ CAT II OR CAT III AND FOR GLS ⋖ CAT I

Ident.: LIM-AFS-20-00020144.0015001 / 07 SEP 17

5 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

Headwind : 15 kt

Tailwind : 10 kt

Crosswind : 10 kt

Note: *Wind limitation is based on the surface wind reported by ATC. If the wind displayed on the ND exceeds the above-noted autoland limitations, but the tower reports surface wind within the limitations, then the autopilot can remain engaged. If the tower reports a surface wind that exceeds the limitations, only CAT I automatic approach without autoland can be performed.*

MAXIMUM WIND CONDITIONS FOR ILS/MLS ⋖ CAT II OR CAT III AND FOR GLS ⋖ CAT I

Ident.: LIM-AFS-20-00020144.0001001 / 17 MAR 17

6 **Applicable to: MSN 01767-05411**

Headwind : 30 kt

Tailwind : 10 kt

Crosswind : 20 kt

Note: Wind limitation is based on the surface wind reported by ATC. If the wind displayed on the ND exceeds the above-noted autoland limitations, but the tower reports a surface wind within the limitations, then the autopilot can remain engaged. If the tower reports a surface wind beyond limitations, only CAT I automatic approach without autoland can be performed.

MAXIMUM WIND CONDITIONS FOR ILS/MLS ⩤ CAT II OR CAT III AND FOR GLS ⩤ CAT I

Ident.: LIM-AFS-20-00020144.0010001 / 17 MAR 17

7 **Applicable to: MSN 06720-06952, 07001-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

Headwind : 30 kt

Tailwind : 10 kt

Crosswind : 20 kt (15 kt with One Engine Inoperative (OEI) and with Automatic Rollout)

Note: Wind limitation is based on the surface wind reported by ATC. If the wind displayed on the ND exceeds the above-noted autoland limitations, but the tower reports surface wind within the limitations, then the autopilot can remain engaged. If the tower reports a surface wind that exceeds the limitations, only CAT I automatic approach without autoland can be performed.

MAXIMUM WIND CONDITIONS FOR ILS/MLS ⩤ CAT II OR CAT III AND FOR GLS ⩤ CAT I

Ident.: LIM-AFS-20-00020144.0005001 / 17 MAR 17

Applicable to: MSN 05437-06336

Headwind : 30 kt

Tailwind : 10 kt

Crosswind : 20 kt without Automatic Rollout / 15 kt with Automatic Rollout

Note: Wind limitation is based on the surface wind reported by ATC. If the wind displayed on the ND exceeds the above-noted autoland limitations, but the tower reports a surface wind within the limitations, then the autopilot can remain engaged. If the tower reports a surface wind beyond limitations, only CAT I automatic approach without autoland can be performed.

MAXIMUM WIND CONDITIONS FOR ILS/MLS ⩤ CAT II OR CAT III AND FOR GLS ⩤ CAT I

Ident.: LIM-AFS-20-00020144.0009001 / 17 MAR 17

Applicable to: MSN 06967

Headwind : 20 kt

Tailwind : 5 kt

Crosswind : 15 kt

Note: Wind limitation is based on the surface wind reported by ATC. If the wind displayed on the ND exceeds the above-noted autoland limitations, but the tower reports a surface wind within the limitations, then the autopilot can remain engaged. If the tower reports a surface wind beyond limitations, only CAT I automatic approach without autoland can be performed.

AUTOMATIC LANDING

Applicable to: MSN 01767-01920, 02388, 02584, 02712, 03138, 04294, 04314, 04393-04438, 04510

Ident.: LIM-AFS-20-10-00020149.0001001 / 17 MAR 17

ILS/MLS ◁ CAT II and CAT III autoland and GLS ◁ CAT I autoland are approved in CONF 3 and CONF FULL.

Ident.: LIM-AFS-20-10-00020150.0001001 / 17 MAR 17

Automatic landing is demonstrated:

- With CAT II and CAT III ILS/MLS ◁ beam and CAT I GLS ◁ beam.

Ident.: LIM-AFS-20-10-00020151.0001001 / 17 MAR 17

[8] - With a glide slope angle between -2.5 ° and -3.15 °

Ident.: LIM-AFS-20-10-00020152.0001001 / 17 MAR 17

- With an airport elevation at or below 2 500 ft

Ident.: LIM-AFS-20-10-00020155.0001001 / 17 MAR 17

[9] Automatic landing is not allowed below -1 000 ft pressure altitude.

Ident.: LIM-AFS-20-10-00020156.0001001 / 03 OCT 17

[10] Automatic rollout performance is approved on dry and wet runways, but performance on snow-covered or icy runways was not demonstrated.

During automatic rollout with one engine inoperative or one thrust reverser inoperative, the flight crew can use the remaining thrust reverser, provided that the wind does not exceed the maximum wind conditions for automatic rollout.

Ident.: LIM-AFS-20-10-00020158.0001001 / 17 MAR 17

Automatic landing system performance is demonstrated with CAT II or CAT III ILS/MLS ◁ airport installation. However, automatic landing in CAT I or better weather conditions is possible on CAT I ground installations or on CAT II/III ground installations when ILS/MLS ◁ sensitive areas are not protected, if the following precautions are taken:

- The airline checked that the ILS/MLS ◁ beam quality, and the effect of the terrain profile before the runway have no adverse effect on AP/FD guidance. Particularly, the effect of terrain profile within 300 m before the runway threshold must be evaluated
- The flight crew is aware that LOC or G/S beam fluctuations, independent of the aircraft system, may occur. The PF is prepared to immediately disconnect the autopilot, and to take the appropriate action, should not satisfactory guidance occur
- At least CAT2 capability is displayed on the FMA and the flight crew uses CAT II/III procedures
- Visual references are obtained at an altitude appropriate for the CAT I approach. If not, a go-around must be performed.

Ident.: LIM-AFS-20-10-00021180.0003001 / 25 JAN 18

- With aircraft weight below the maximum landing weight

AUTOMATIC LANDING

EGT

Maximum EGT for APU start (below 35 000 ft)..... 1 090 °C
Maximum EGT for APU start (above 35 000 ft).....1 120 °C
Maximum EGT for APU running.....675 °C

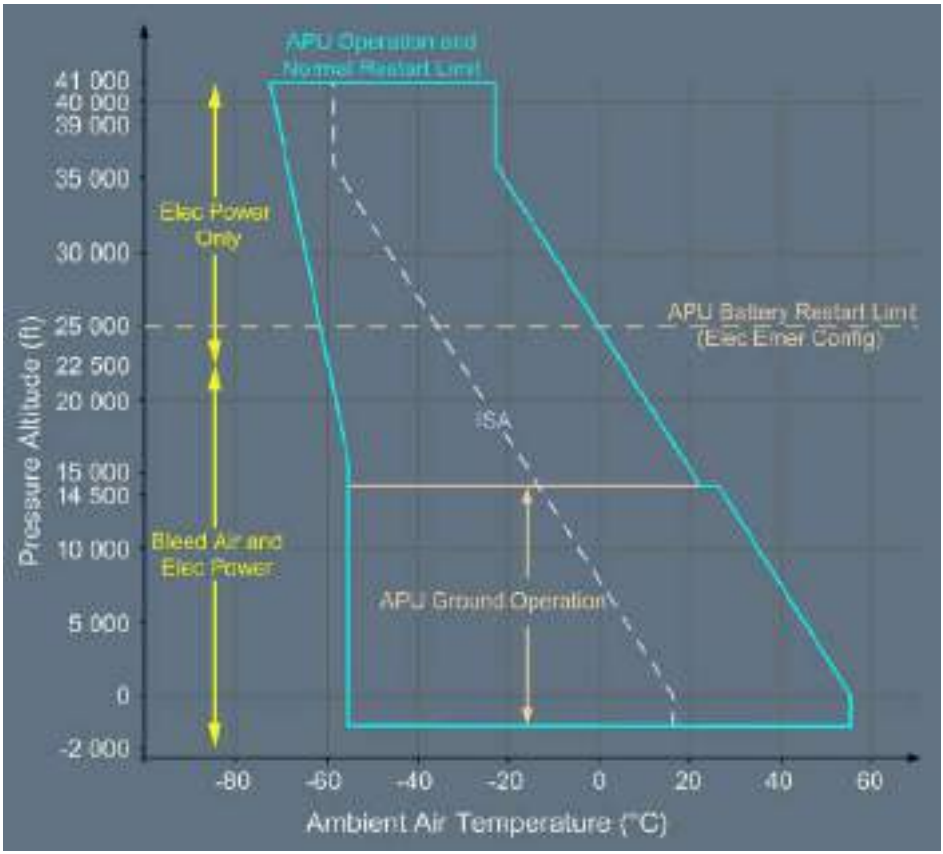
Ident.: LIM-APU-10-00020090.0002001 / 17 MAR 17

[2] **Applicable to: MSN 01957-02097, 02121-02195, 02275, 02359, 02405, 02482, 02609-02626, 02712, 03071, 03308, 03357-03618, 03782-04216, 04312-04397, 04481-04506, 04518-05155, 05190-06336, 09063**

EGT

Maximum EGT for APU start (below 25 000 ft)..... 900 °C
Maximum EGT for APU start (above 25 000 ft).....982 °C
Maximum EGT for APU running (with 5 s confirmation for shutdown)..... 682 °C
Maximum EGT for APU running (for immediate shutdown)..... 700 °C to 742 °C

APU START/SHUTDOWN DURING REFUELING/DEFUELING



Ident.: LIM-APU-00020091.0001001 / 17 MAR 17
Applicable to: ALL

During refuel/defuel procedures, APU starts or shutdown are permitted with the following restrictions:
- If the APU failed to start or following an automatic APU shutdown, do not start the APU
- If a fuel spill occurs, perform a normal APU shutdown.

STARTER

Ident.: LIM-ENG-00020356.0004001 / 20 MAR 17

7 **Applicable to: MSN 06720-09063**

- A standard automatic start that includes up to three start attempts, is considered one cycle
- For ground starts (automatic or manual), a 35 s pause is required between successive cycles
- A 15 min cooling period is required, subsequent to three failed cycles, or 15 min of continuous or cumulated crank
- The starter must not be run when N2 is above 20 %.

STARTER

Ident.: LIM-ENG-00020356.0002001 / 20 MAR 17

8 **Applicable to: MSN 01957-02359, 02405-02482, 02609-02670, 02737-03071, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-06336**

- A standard automatic start that includes only one start attempt, is considered one cycle
- For ground starts (automatic or manual), a 15 s pause is required between successive cycles
- A 30 min cooling period is required, subsequent to three failed cycles or 5 min of continuous crank
- For manual start, observe a two-minute maximum cycle time
- For crank, observe a 5 min maximum cycle time
- The starter must not be run when N2 is above 10 % on-ground and 18 % in-flight.

STARTER

Ident.: LIM-ENG-00020356.0001001 / 20 MAR 17
Applicable to: MSN 01767-01920, 02388, 02584, 02712, 03138, 03750, 04294, 04314, 04393-04438, 04510

- A standard automatic start that includes up to three start attempts, is considered one cycle
- For ground starts (automatic or manual), a 20 s pause is required between successive cycles
- A 15 min cooling period is required, subsequent to four failed cycles
- The starter must not be run when N2 is above 20 %.

REVERSE THRUST

Ident.: LIM-ENG-00020357.0001001 / 20 MAR 17
Applicable to: ALL

Selection of the reverse thrust is prohibited in flight.
Backing the aircraft with reverse thrust is not permitted.
Maximum reverse should not be used below 70 kt. Idle reverse is permitted down to aircraft stop.

REDUCED THRUST TAKEOFF

Ident.: LIM-ENG-10-00020358.0046001 / 01 JUN 17

9 **Applicable to: MSN 06720-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

FLEX TAKEOFF

Takeoff at reduced thrust, so-called as FLEX takeoff, is permitted only if the airplane meets all performance requirements at the takeoff weight, with the operating engines at the thrust available for the flexible temperature (TFLEX).
Takeoff at reduced thrust is permitted with any inoperative item affecting the performance only if the associated performance shortfall has been applied to meet the above requirements.
FLEX takeoff is not permitted on contaminated runways.

TFLEX cannot be:
- Higher than TMAXFLEX, equal to ISA + 50 °C.
- Lower than the flat temperature (TREF).
- Lower than the actual OAT.

Ident.: LIM-ENG-10-00020358.0044001 / 01 JUN 17

10 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

FLEX TAKEOFF

Takeoff at reduced thrust, so-called as FLEX takeoff, is permitted only if the airplane meets all performance requirements at the takeoff weight, with the operating engines at the thrust available for the flexible temperature (TFLEX).
Takeoff at reduced thrust is permitted with any inoperative item affecting the performance only if the associated performance shortfall has been applied to meet the above requirements.
FLEX takeoff is not permitted on contaminated runways.

TFLEX cannot be:
- Higher than TMAXFLEX, equal to ISA + 49 °C.
- Lower than the flat temperature (TREF).
- Lower than the actual OAT.

Ident.: LIM-ENG-10-00020358.0004001 / 20 MAR 17

Applicable to: MSN 02108, 02135, 02139-02359, 02405-02482, 02609-02670, 02737-02914, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04488, 04506, 04518, 04535-04637, 04752-05094, 05155-05190, 05230-06336

FLEX TAKEOFF

Takeoff at reduced thrust, so-called as FLEX takeoff, is permitted only if the airplane meets all performance requirements at the takeoff weight, with the operating engines at the thrust available for the flexible temperature (TFLEX).
Takeoff at reduced thrust is permitted with any inoperative item affecting the performance only if the associated performance shortfall has been applied to meet the above requirements.

FLEX takeoff is not permitted on contaminated runways.

TFLEX cannot be:
- Higher than TMAXFLEX, equal to ISA + 55 °C.
- Lower than the flat temperature (TREF).
- Lower than the actual OAT.

Ident.: LIM-ENG-10-00020358.0008001 / 01 JUN 17
Applicable to: MSN 01767-01920, 02388, 02584, 02712, 03138, 03750, 04294, 04314, 04393-04438, 04510

FLEX TAKEOFF

Takeoff at reduced thrust, so-called as FLEX takeoff, is permitted only if the airplane meets all performance requirements at the takeoff weight, with the operating engines at the thrust available for the flexible temperature (TFLEX).
Takeoff at reduced thrust is permitted with any inoperative item affecting the performance only if the associated performance shortfall has been applied to meet the above requirements.
FLEX takeoff is not permitted on contaminated runways.

TFLEX cannot be:
- Higher than TMAXFLEX, equal to ISA + 53 °C. TMAXFLEX corresponds to a reduction of 25 % from the full rated takeoff thrust.
- Lower than the flat temperature (TREF).
- Lower than the actual OAT.

Ident.: LIM-ENG-10-00020358.0017001 / 01 JUN 17
11 **Applicable to: MSN 01957-02097, 02121, 02138, 03071, 04491, 04532, 04645, 05120, 05218**

FLEX TAKEOFF

Takeoff at reduced thrust, so-called as FLEX takeoff, is permitted only if the airplane meets all performance requirements at the takeoff weight, with the operating engines at the thrust available for the flexible temperature (TFLEX).
Takeoff at reduced thrust is permitted with any inoperative item affecting the performance only if the associated performance shortfall has been applied to meet the above requirements.
FLEX takeoff is not permitted on contaminated runways.

TFLEX cannot be:
- Higher than TMAXFLEX, equal to ISA + 72 °C.
- Lower than the flat temperature (TREF).
- Lower than the actual OAT.

Ident.: LIM-ENG-10-00020359.0001001 / 20 MAR 17
Applicable to: ALL

DERATED TAKEOFF

Selection of TOGA thrust is not permitted when a derated takeoff is performed, except when requested in any abnormal or emergency procedures.
The use of reduced thrust takeoff (FLEX takeoff) is not permitted in association with derated takeoff.
The use of derated takeoff is permitted regardless of the runway condition (dry, wet, or contaminated).

CROSSWIND OPERATION ON GROUND

Ident.: LIM-ENG-00020360.0003001 / 20 MAR 17
12 **Applicable to: MSN 06720-09063**

ENGINE START

The engine is able to start in crosswind up to 35 kt.

CROSSWIND OPERATION ON GROUND

CERTIFIED FUEL

Ident.: LIM-FUEL-00019707.0001001 / 17 MAR 17

[1] **Applicable to: MSN 01767-06336**

The fuel system is certified with: JET A, JET A1, JET B, JP4, JP5, JP8, N° 3 JET, RT, and TS-1, in accordance with engine manufacturers and fuel specifications.

CERTIFIED FUEL

Ident.: LIM-FUEL-00019707.0002001 / 17 MAR 17

[2] **Applicable to: MSN 06720-09063**

The fuel system is certified with: JET A, JET A1, JP5, JP8, N° 3 JET, RT, and TS-1, in accordance with engine manufacturers and fuel specifications.

FUEL TEMPERATURE

Ident.: LIM-FUEL-00019708.0001001 / 28 NOV 17

[3] **Applicable to: MSN 01767-06336**

	JET A1/JP8/ N°3 JET	JET A	JP5	RT	TS-1	JET B	JP4
MINI	-43 °C	-36 °C (1)	-42 °C	-45 °C	-45 °C	-46 °C	-54 °C
MAXI	54 °C					49 °C	

(1) *For JET A only, if TAT reaches -34 °C, monitor the fuel temperature on the FUEL SD page, to ensure that it remains above -36 °C.*

Note: The various types of fuel can be mixed in all proportions. However, in the case of fuel mixture, the minimum fuel specification values provided in the table above are no longer applicable.

FUEL TEMPERATURE

Ident.: LIM-FUEL-00019708.0002001 / 28 NOV 17

[4] **Applicable to: MSN 06720-09063**

	JET A1/JP8/ N°3 JET	JET A	JP5	RT	TS-1
MINI	-43 °C	-36 °C (1)	-42 °C	-45 °C	-45 °C
MAXI	55 °C				

(1) *For JET A only, if TAT reaches -34 °C, monitor the fuel temperature on the FUEL SD page, to ensure that it remains above -36 °C.*

Note: *The various types of fuel can be mixed in all proportions. However, in the case of fuel mixture, the minimum fuel specification values provided in the table above are no longer applicable.*

FUEL TEMPERATURE LIMITS WHEN JP4 AND JET B FUELS ARE USED

Ident.: LIM-FUEL-00019709.0001001 / 17 MAR 17

5 **Applicable to: MSN 01767-06036**

If the wing fuel temperature exceeds 30 °C at engine start, the altitude must be limited to 35 000 ft until the center tank is empty.
If the wing fuel temperature exceeds 40 °C at engine start, the altitude must be limited to 30 000 ft until the center tank is empty.
If the wing fuel temperature exceeds 49 °C at engine start, the altitude must be limited to 25 000 ft until the center tank is empty.

Reason : At high altitude with high fuel temperature, the pressure supplied by the center tank pumps becomes lower than the pressure supplied by the wing tank pumps.

MAXIMUM ALLOWED FUEL IMBALANCE

Ident.: LIM-FUEL-00020435.0001001 / 17 MAR 17

6 **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

The following tables indicate the maximum allowed wing imbalance at takeoff, in flight, and at landing.

FUEL IMBALANCE AT TAKEOFF

INNER TANKS (OUTER TANKS BALANCED)

Tank Fuel Quantity (Heavier Tank)	Maximum Asymmetry
Full	500 kg (1 102 lb)
3 000 kg (6 613 lb)	1 050 kg (2 314 lb)
1 450 kg (3 196 lb)	1 450 kg (3 196 lb)

The variation is linear between these values.

OUTER TANKS (INNER TANKS BALANCED)

Maximum Asymmetry	370 kg (815 lb)

FUEL IMBALANCE IN FLIGHT AND AT LANDING

INNER TANKS (OUTER TANKS BALANCED)

Tank Fuel Quantity (Heavier Tank)	Maximum Asymmetry
Full	1 500 kg (3 306 lb)
4 300 kg (9 479 lb)	1 600 kg (3 527 lb)
2 250 kg (4 960 lb)	2 250 kg (4 960 lb)

The variation is linear between these values, and there is no limitation below 2 250 kg (4 960 lb).

OUTER TANKS

Maximum Asymmetry	690 kg (1 521 lb)(1)

(1) *The maximum fuel imbalance in the outer wing fuel tanks (one full/one empty) is allowed provided that:*
- *The fuel quantity of the outer and inner wing fuel tanks of one side is equal to the fuel quantity of the outer and inner wing fuel tanks on the other side, or*
- *On the side of the lighter outer tank, the fuel quantity of the inner tank is more than the fuel quantity of the opposite inner tank. The difference between the fuel quantity in the inner tanks should not be more than 3 000 kg (6 613 lb).*

Note: In exceptional conditions (i.e. fuel system failure), the above-mentioned values for maximum fuel imbalance may be exceeded without significant effect to the aircraft handling qualities. The aircraft remains fully controllable in all flight phases.

MAXIMUM ALLOWED FUEL IMBALANCE

Ident.: LIM-FUEL-00020435.0008001 / 17 MAR 17

7 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

The following tables indicate the maximum allowed wing imbalance at takeoff, in flight, and at landing.

FUEL IMBALANCE AT TAKEOFF

Tank Fuel Quantity (Heavier Tank)	Maximum Asymmetry
Full	400 kg (882 lb)
3 000 kg (6 614 lb)	400 kg (882 lb)
700 kg (1 543 lb)	700 kg (1 543 lb)

The variation is linear between these values.

FUEL IMBALANCE IN FLIGHT AND AT LANDING

Tank Fuel Quantity (Heavier Tank)	Maximum Asymmetry
Full	1 320 kg (2 910 lb)
4 000 kg (8 818 lb)	1 450 kg (3 196 lb)
2 350 kg (5 180 lb)	2 350 kg (5 180 lb)

The variation is linear between these values, and there is no limitation below 2 350 kg (5 180 lb).

Note: In exceptional conditions (i.e. fuel system failure), the above-mentioned values for maximum fuel imbalance may be exceeded without significant effect to the aircraft handling qualities. The aircraft remains fully controllable in all flight phases.

MINIMUM FUEL QUANTITY FOR TAKEOFF

Ident.: LIM-FUEL-00019771.0001001 / 17 MAR 17
Applicable to: ALL

Minimum fuel quantity for takeoff.....1 500 kg (3 307 lb)
The ECAM alerts that are related to fuel low level in the wing tanks (FUEL WING TK LO LVL, etc.) must not appear for takeoff.

LIMITATIONS

ICE AND RAIN PROTECTION

Intentionally left blank

Definition of Icing Conditions....A
Definition of Severe Ice Accretion....B
Definition of Thin Hoarfrost....C
Rain Repellent ◁ ....D
Wipers Maximum Operating Speed....E

Intentionally left blank

DEFINITION OF ICING CONDITIONS

Ident.: LIM-ICE_RAIN-00020608.0001001 / 05 JUN 18
Applicable to: ALL

- Icing conditions exist when the OAT (on ground or after takeoff) or the TAT (in flight) is at or below 10 °C and visible moisture in any form is present (such as clouds, fog with visibility of 1 sm (1 600 m) or less, rain, snow, sleet or ice crystals).
- Icing conditions also exist when the OAT on the ground and for takeoff is at or below 10 °C and operating on ramps, taxiways or runways where surface snow, standing water or slush may be ingested by the engines, or freeze on engines, nacelles or engine sensor probes.

DEFINITION OF SEVERE ICE ACCRETION

Ident.: LIM-ICE_RAIN-00020609.0001001 / 17 MAR 17
Applicable to: ALL

Ice accretion is considered severe when the ice accumulation on the airframe reaches approximately 5 mm (0.2 in) thick or more.

DEFINITION OF THIN HOARFROST

Ident.: LIM-ICE_RAIN-00020610.0001001 / 17 MAR 17
Applicable to: ALL

Thin hoarfrost is typically a white crystalline deposit which usually develops uniformly on exposed surfaces on cold and cloudless nights.
It is so thin that surface features (lines or markings) can be distinguished beneath it.

RAIN REPELLENT ⋖

Ident.: LIM-ICE_RAIN-00020224.0001001 / 17 MAR 17
Applicable to: ALL

The flight crew should only use the rain repellent in the case of moderate to heavy rain.

WIPERS MAXIMUM OPERATING SPEED

Ident.: LIM-ICE_RAIN-00020225.0001001 / 17 MAR 17
Applicable to: ALL

Refer to LIM-AG-SPD Wipers Maximum Operating Speed.

Intentionally left blank

LIMITATIONS

LANDING GEAR

Intentionally left blank

Braking System....A
Brake Temperature....B
Maximum Speeds with the Landing Gear Extended....C
Maximum Tire Speed....D
Nosewheel Steering (NWS)....E
Taxi with Deflated or Damaged Tires....F

Intentionally left blank

BRAKING SYSTEM

Ident.: LIM-LG-00020233.0001001 / 17 MAR 17
Applicable to: ALL

The braking system is not designed to hold the aircraft in a stationary position when a high thrust level is applied on at least one engine.
During ground procedures that require a thrust increase with braking, the flight crew must ensure that the aircraft remains stationary, and must be ready to immediately retard the thrust levers to IDLE.

BRAKE TEMPERATURE

Ident.: LIM-LG-00020255.0001001 / 17 MAR 17
Applicable to: ALL

Maximum brake temperature for takeoff (brake fans ◁ off).....300 °C

MAXIMUM SPEEDS WITH THE LANDING GEAR EXTENDED

Ident.: LIM-LG-00020237.0001001 / 17 MAR 17
Applicable to: ALL

Refer to LIM-AG-SPD Maximum Speeds with the Landing Gear Extended.

MAXIMUM TIRE SPEED

Ident.: LIM-LG-00020238.0001001 / 17 MAR 17
Applicable to: ALL

Refer to LIM-AG-SPD Maximum Tire Speed.

NOSEWHEEL STEERING (NWS)

Ident.: LIM-LG-00020236.0001001 / 12 SEP 17
Applicable to: ALL

For NWS angle limit, *Refer to DSC-20-30 Taxiing*.
Towbarless operation on the nose landing gear (towing and pushback) is approved when using the accepted towbarless towing vehicles listed in the Airbus WISE ISI 09.11.00001, with the following information:
Maximum NWS angle..... ±85 °

TAXI WITH DEFLATED OR DAMAGED TIRES

Ident.: LIM-LG-00020235.0001001 / 01 JUN 17
Applicable to: ALL

To vacate the runway or taxi at low speed with tire(s) deflated (not damaged), all of the following limitations apply:

- If maximum one tire per gear is deflated (consider three gears)
  Maximum taxi speed during turn..... 7 kt
- If two tires are deflated on the same main gear (maximum one main gear)
  Maximum taxi speed..... 3 kt
- For the nosewheel steering (NWS) angle
  Maximum NWS angle..... 30 °

In addition, if tire damage is suspected, the flight crew must ask for an aircraft inspection prior to vacate the runway or taxi. If the ground crew suspects that a tire burst may damage the landing gear, maintenance action is due.

For more information, *Refer to FCTM/PR-AEP-LG Taxi with Deflated or Damaged Tires*.

GPWS / Predictive GPWS ..... A

Intentionally left blank

GPWS / PREDICTIVE GPWS ◁

Ident.: LIM-SURV-00019775.0001001 / 17 AUG 18
Applicable to: ALL

Aircraft navigation must not be based on the use of the terrain display .
The terrain display is intended to serve as a situation awareness tool only, and may not provide the accuracy on which to solely base terrain avoidance maneuvering.

The predictive GPWS ◁ functions should be inhibited (TERR pushbutton to OFF, on the GPWS panel) when the aircraft position is less than 15 NM from the airfield:

- For operations from/to runways not incorporated in the predictive GPWS database.
- For specific approach or departure procedures, which have previously been identified as potentially causing expected or spurious terrain alerts.

Only aircraft with Man-made Obstacle Function ◁ can display obstacles on ND and trigger alerts, based on a dedicated database which includes artificial obstacles worldwide.

General Description..... A

Intentionally left blank

GENERAL DESCRIPTION

Applicable to: ALL

Ident.: OEB-GEN-A-00014181.0001001 / 23 NOV 11

An Operations Engineering Bulletin (OEB) is issued to rapidly inform operators of any deviations from initial design objectives that have a significant operational impact. An OEB provides the operators with technical information and temporary operational procedures that address these deviations.

Ident.: OEB-GEN-A-00014182.0001001 / 23 NOV 11

TYPE OF OEB

OEBs can either be red or white, depending on their level of priority.

- RED OEBs are issued to indicate that non-compliance with the recommended procedures may have a significant impact on the safe operation of the aircraft.
- WHITE OEBs are issued to indicate that non-compliance with the recommended procedures may have a significant impact on aircraft operation.

Airbus strongly recommends that all Operators rapidly apply the OEB corrective actions as soon as they become available, particularly for red OEBs.

Ident.: OEB-GEN-A-00014183.0001001 / 23 JUN 15

OEB CONTENT AND MANAGEMENT

An OEB:
- Is temporary and usually focuses on one operational subject only,
- Is included in the OEB section of both the FCOM and QRH. The procedural part of each white or red OEB (OEB PROC) is provided in the OEB section of the QRH, so that the flight crew can easily access the procedures,
- Remains applicable until the appropriate corrective actions are completed.

Note: After installation of the OEB corrective modification/Service Bulletins (SB): if an Operator reinstalls any spare equipment for which there was an associated OEB, it is Operator's responsibility to ensure that this OEB be applied again for the applicable aircraft.

OEB IN THE FCOM

The content of each OEB includes:
- The reason for issue,
- Technical explanations of the deviation from the initial design objectives,
- The operational impact if the flight crew does not apply the OEB procedure,

Continued on the following page

GENERAL DESCRIPTION (Cont'd)

- The conditions for applying the OEB procedures :
  - ECAM warning/caution affected by the OEB,
  - Cockpit effects,
  - Flight phases,
  - Specific event.
- The OEB operational procedure(s) to be applied,
- The corrective actions that cancel the OEB (if available),
- The OEB REMINDER codes, (if applicable).

OEB IN THE QRH

Each FCOM OEB has an associated “OEB PROC” in the OEB section of the QRH, that includes:

- The title of the OEB PROC,
- The “ECAM ENTRY" field:
  This section identifies whether or not one of the possible conditions for applying the OEB PROC is an ECAM warning/caution.
  The flight crew must disregard the ECAM procedure and/or STATUS of the ECAM alerts listed in the "ECAM ENTRY" field and must apply the QRH’s OEB procedure instead.
- The OEB operational procedure(s) that the flight crew must apply.

FCOM LIST OF EFFECTIVE OEB

The List of Effective Operations Engineering Bulletins (LEOEB) enables to review all the Operations Engineering Bulletins (OEBs) that are applicable to the fleet. Each time an OEB is issued or revised, the LEOEB is updated.

The FCOM LEOEB consists of:

Continued on the following page

GENERAL DESCRIPTION (Cont'd)

The "M" field that may provide the following Evolution Code:
- The "N" letter indicates a new OEB, or
- The "R" letter indicates a revised OEB, or
- The "E" letter indicates an aircraft validity change on the OEB.

The "Identification" field which identifies the OEB with its identification number.

Note: *The FCOM OEB and associated QRH OEB PROC have the same OEB number in order to be consistent. However, the issue number of the QRH OEB PROC and the FCOM OEB may be different, because a revision of an FCOM OEB does not necessarily result in a revision of the corresponding QRH OEB PROC, that only provides the procedure part.*

The "T" field indicates the Type of OEB:
- The "W" letter indicates a white OEB, or
- The "R" letter indicates a red OEB.

Note: *OEBs are listed by type of OEB (RED OEBs first, then WHITE OEBs), and in numerical order for each type of OEB. This enables the flight crew to easily review the OEBs before flight.*

The "E" field indicates whether or not the OEB affects ECAM procedure(s). This enables the flight crew to easily review the OEBs before flight particularly for Operators that use the OEB REMINDER function:
- The "Y" letter indicates that the OEB affects only ECAM procedure(s),
- The "N" letter indicates that at least one of the procedures provided in the OEB does not affect ECAM procedure(s).

CAUTION	When Airbus provides the Operator with the LEOEB, the information "AFFECTS ECAM : Y" ("E" field) does not necessarily mean that (for Operators using the OEB REMINDER function) the Operator's maintenance personnel has activated the OEB REMINDER codes for this OEB onboard the aircraft. It is the Operator's responsibility to define a suitable process for providing the flight crew with confirmation that the OEB REMINDER codes are activated for the ECAM alerts affected by OEBs.

The "Rev Date" field indicates the date at which the OEB content was issued/changed
The "Title" field provides the OEB title.

Continued on the following page

GENERAL DESCRIPTION (Cont'd)

QRH LIST OF EFFECTIVE OEB

The List of Effective Operations Engineering Bulletins (LEOEB) enables to review all the Operations Engineering Bulletins (OEBs) that are applicable to the fleet. Each time an OEB is issued or revised, the LEOEB is updated.

The QRH LEOEB consists of:
The "Identification" field which identifies the OEB with its identification and issue number.

Note: The FCOM OEB and associated QRH OEB PROC have the same OEB number in order to be consistent. However, the issue number of the QRH OEB PROC and the FCOM OEB may be different, because a revision of an FCOM OEB does not necessarily result in a revision of the corresponding QRH OEB PROC, that only provides the procedure part.

Red OEB identification number and title are in bold font. White OEB identification number and title are in regular font. This enables the flight crew to easily review the OEBs before flight.

Note: OEBs are listed in numerical order regardless of the type of OEB (red or white).

The "Title" field provides the OEB title and the "ECAM Entry" part of the OEB PROC. This enable the flight crew to easily review the OEBs before flight particularly for Operators that use the OEB REMINDER function.

Continued on the following page

GENERAL DESCRIPTION (Cont'd)

CAUTION	When Airbus provides the Operator with the LEOEB, the information "ECAM Entry " does not necessarily mean that (for Operators using the OEB REMINDER function) the Operator's maintenance personnel has activated the OEB REMINDER codes for this OEB onboard the aircraft. It is the Operator's responsibility to define a suitable process for providing the flight crew with confirmation that the OEB REMINDER codes are activated for the ECAM alerts affected by OEBs.

A vertical bar in the margin of the QRH LEOEB identifies that the OEB is either new, revised or has an aircraft validity change.

Ident.: OEB-GEN-A-00014184.0001001 / 23 NOV 11

REVIEW OF THE OEB

In accordance with the Standard Operating Procedures, and before each flight, the flight crew must review all OEBs that are applicable to their aircraft. If the OEB conditions are applicable, the flight crew must apply the operational procedure(s) that is in the QRH OEB section.

Ident.: OEB-GEN-A-00014185.0001001 / 23 NOV 11

DISTRIBUTION

OEB are distributed to all affected Operators. The Operators shall provide flight crews with the content of the OEB without delay.

Ident.: OEB-GEN-A-00014186.0001001 / 23 JUN 15

OEB REMINDER FUNCTION

The OEB reminder function provides operational help to the flight crew by enabling them to clearly identify on the ECAM all procedures and STATUS messages superseded by an OEB procedure. When a situation causes an ECAM warning/caution to trigger, a message informs the flight crew in real time that there is an OEB for the displayed ECAM warning/caution and/or STATUS, and as a result, that the ECAM procedure and/or STATUS is changed. In this case, a specific ECAM message informs the flight crew to refer to the QRH. For more information *Refer to FCOM DSC-31-OEB Reminder*.

The OEB reminder function may not be activated for some OEBs. For example, when an OEB procedure supersedes an ECAM procedure, under specific conditions only, the OEB reminder function is not activated, in order to let the flight crew assess the need to apply the OEB procedure or the ECAM procedure.

The OEB reminder function does not relieve the flight crew of their responsibility to review the applicable OEBs during the cockpit preparation.

Continued on the following page

GENERAL DESCRIPTION (Cont'd)

OEB REMINDER CODE

The maintenance personnel must enter specific OEB REMINDER code(s) in the FWC OEB database in order to update the ECAM.
These OEB REMINDER codes are provided in the FCOM OEB chapter only, and are sent to the Operator's Flight Operations department along with the associated QRH OEB PROC. This is to ensure that the OEB database is not updated before the OEB procedure is available in the QRH and FCOM onboard documentation.

Good coordination between the Airline's/Operator's Flight Operations department and the Airline's/Operator's Engineering department must be established, in order to:

- Ensure that the QRH OEB section is updated onboard the aircraft before the activation of the OEB REMINDER function for a specific OEB.
- Rapidly send information about the OEB REMINDER codes to the Engineering department for a rapid update of the ECAM.
- Provide the flight crew with confirmation that the OEB REMINDER codes are activated onboard the aircraft for the ECAM alerts affected by OEBs.

CAUTION	As soon as the maintenance personnel has embodied the corrective action that cancels the OEB on a specific aircraft, the Operator must ensure that: 1. Maintenance personnel has deactivated the OEB REMINDER function for the specific OEB, before informing their Flight Operations department of the installation of the OEB correction action. 2. The QRH OEB section onboard the aircraft is updated to remove the specific OEB from the applicable aircraft.

NO LOCALIZER OR GLIDE SLOPE CAPTURE IN APPROACH

Ident.: OEB-28-00013496.0001001 / 27 MAY 13
Applicable to: MSN 01767

Approved by: Head of Airbus Flight Operations & Training Support

- This OEB covers a significant operational issue. Non-compliance with this OEB may have a significant impact on the operations of the aircraft. Airbus recommends that the operators apply this OEB within 30 days from the date of issue of this OEB.
- An extract of this OEB is provided for insertion in the QRH.
- Airbus recommends that all operators rapidly incorporate the corrective Service Bulletins that cancel this OEB when they become available.

Reason for issue:

Issue 02:
This OEB issue 02 removes the electronic link to the FCOM in the frame of the publication of the new FCOM Approach SOPs.
There is no technical change in the procedure.
Issue 01:
This OEB replaces the A320 OEB 184.
Several Operators experienced the following event: LOC* (G/S*) capture mode did not engage when intercepting the localizer (glide slope) during an ILS approach.
This OEB provides an explanation of the above-mentioned event, as well as the operational recommendations that the flight crew should apply, in order to intercept the ILS using LOC and G/S modes.

Applicable to: Aircraft with Rockwell Collins Multi-Mode Receiver (MMR), P/N 822-1152-121 (MOD 26999 or MOD 30631)

Cancelled by: MMR P/N 822-1152-122 (MOD 37356)

Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.

Operations Engineering Bulletins are issued by Airbus, as the need arises, to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.
The information in the OEB is recommended by Airbus, but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

NO LOCALIZER OR GLIDE SLOPE CAPTURE IN APPROACH

Ident.: OEB-28-00013497.0001001 / 27 MAY 13
Applicable to: MSN 01767

EXPLANATION

Investigations have indicated that the LOC* capture mode did not engage due to an automatic, internal reset of one Multi-Mode Receiver (MMR). This automatic reset causes the LOC and/or G/S deviation data computed by this MMR to continuously change from Normal Operation to No Computed Data, approximately every second. This can only be stopped, on ground, if the maintenance crew cuts the MMR power for more than 10 s.
The Master FMGC must receive a valid LOC signal from its onside MMR for a minimum of 3 s to enable LOC* mode engagement. When the MMR associated to the Master FMGC periodically resets, the associated LOC signal is valid for less than one second, which explains why the LOC* mode does not engage.
In such cases, when the AP and/or FD is engaged and the LOC and G/S modes are armed, the aircraft may unexpectedly fly through the ILS beam without capturing it. The ILS identification and deviation symbols displayed on the PFD (and on the ND in ROSE-LS mode) may intermittently disappear. However, when displayed, these ILS deviation symbols are reliable.
The possibility of both MMRs being simultaneously affected is very remote. Therefore, it is highly probable that the second MMR is operative and will continue to provide constant and valid data to the Slave FMGC.
If the flight crew changes the AP in command, the Slave FMGC becomes Master, and will use the associated, valid data from its onside MMR. This will enable the localizer and/or the glide slope capture modes to engage.

Note: *1. If both APs are engaged, FMGC1 is Master. To change the Master FMGC from FMGC1 to FMGC2, the flight crew must disengage AP1 pb by pressing the AP1 pb on the FCU.*
2. If the autopilot is disengaged, and both FDs are engaged, FMGC1 is Master by default. It is possible to change the Master FMGC from FMGC1 to FMGC2, by engaging AP2, or disengaging FD1.

PROCEDURE

In accordance with the FCOM Standard Operating Procedures, the flight crew should closely monitor the localizer and glide slope capture, for every ILS approach.

- **If LOC* mode does not engage when expected, the flight crew should:**
  Perform the ILS interception using the LOC raw data deviations. The FD and AP can be used in selected modes (HDG-V/S modes, or preferably TRK-FPA modes) for this purpose.
  Consider changing the Master FMGC:

Continued on the following page

NO LOCALIZER OR GLIDE SLOPE CAPTURE IN APPROACH (Cont'd)

- **If the AP is engaged:**
  Change the AP in command
  (If AP1+2 are engaged, change to AP2, by pressing the AP1 pb on the FCU to disengage AP1)
- **If the AP is disengaged, and the FDs are engaged:**
  Turn off FD1

Then, attempt to reengage the LOC and G/S modes, by pressing the APPR pb.

LOC* (G/S*) mode should engage as expected, and the ILS can then be flown in LOC and G/S modes. However, the flight crew should disregard the approach capability on the FMA, and perform only a CAT I approach with a manual landing.

Note: *If it is still not possible to intercept the ILS after changing the Master FMGC, the flight crew must perform an ILS approach using raw data. The AP/FD can be used in selected modes (HDG/VS, or preferably TRK/FPA). The flight crew should disarm the APPR (LOC) mode(s) by setting the APPR (LOC) pb to OFF on the FCU, and then perform a CAT I approach with a manual landing.*

CORRECTIVE ACTION

This OEB is cancelled by the installation of the MMR P/N 822-1152-122.

INCORRECT VERTICAL PROFILE DURING NON PRECISION APPROACHES

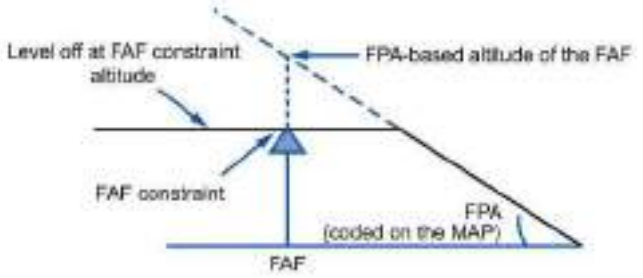
Ident.: OEB-42-00013612.0001001 / 23 JUL 13
Applicable to: MSN 04393-04397

EXPLANATION

BACKGROUND

The FMS computes the vertical profile of the final approach backwards from an anchor point that is the Missed Approach Point (MAP), the Runway threshold (RWY) or the Final End Point (FEP). The FMS adapts its vertical profile to take into account for each waypoint, the following Navigation DataBase data:



- FPAs
- Altitude constraints.

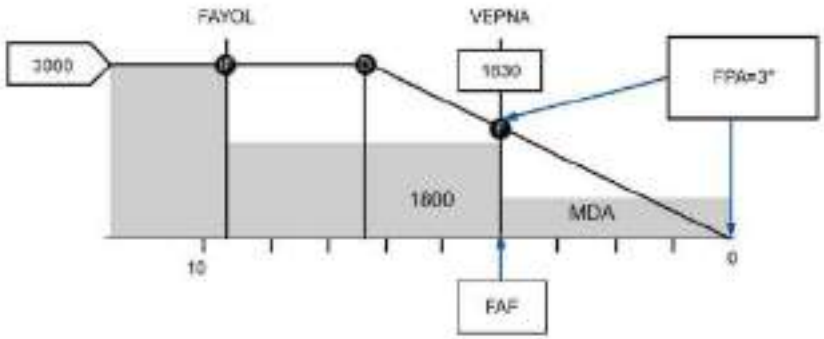
Note: *The OEB scenario can impact RNP AR procedures. However, the mandatory preliminary validation of such procedures enables operators to detect the misbehaviour in advance. It is then possible for operators to ask for a new coding of the approach.*

Note: *The use of FLS is not affected as the computation of the FLS beam is not impacted.*

DESCRIPTION OF THE MISBEHAVIOUR

When the theoretical altitude of the FAF, based on the FPA coded on the anchor point (called "FPA-based altitude" in this document), is higher than or equal to the FAF altitude constraint, the FMS erroneously disregards the FPA coded on the FAF.

As a result, the vertical profile before the FAF may erroneously consist in:

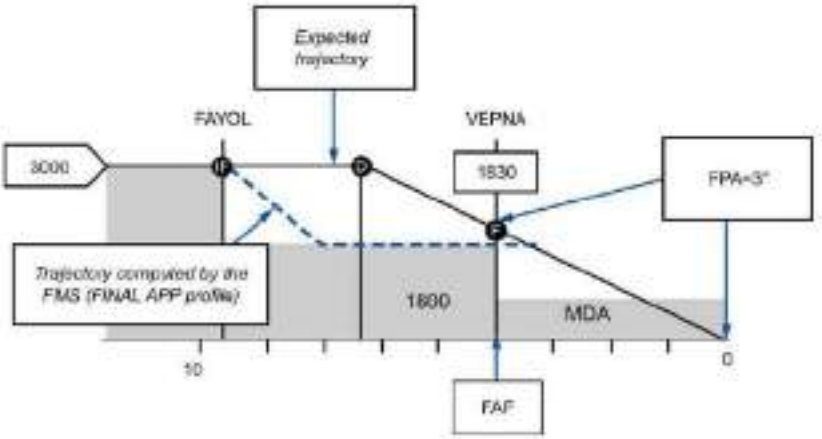


- A descent segment (not respecting the coded FPA), followed by
- A level off at the altitude constraint coded at the FAF.

Continued on the following page

INCORRECT VERTICAL PROFILE DURING NON PRECISION APPROACHES (Cont'd)

Note that this altitude constraint at the FAF should always respect the Minimum Obstacle Clearance (MOC) altitude.
See the below illustration (example):



Approach chart

Continued on the following page

INCORRECT VERTICAL PROFILE DURING NON PRECISION APPROACHES (Cont'd)

Aircraft trajectory

Continued on the following page

INCORRECT VERTICAL PROFILE DURING NON PRECISION APPROACHES (Cont'd)

MCDU example

LIST OF IMPACTED APPROACHES

The Flight Operations/Engineering department of operators can identify the potentially impacted NPAs with the help of:

- A list established by Airbus, or
- With a Navigation DataBase reading tool.

For this second solution, they have to extract from the Navigation DataBase all NPAs having both:

- AT OR ABOVE altitude constraint coded at the FAF
- A FPA coded on the FAF (i.e. intended for the leg preceding the FAF).

When a list of potentially impacted procedures is established, the operator can also study each procedure to check whether the actual FMS vertical profile is acceptable.
This check can be performed in a simulator or with an aircraft when the weather conditions are VMC (Visual Meteorological Conditions). This check enables to establish a list of impacted NPAs.

Continued on the following page

INCORRECT VERTICAL PROFILE DURING NON PRECISION APPROACHES (Cont'd)

PROCEDURE

The following procedure only applies for flight crew.

■ **If the operator has established a list of impacted NPAs, updated with the current Navigation DataBase cycle:**
When preparing a NPA, the flight crew must check if the procedure is in the list or not:

- **If the procedure is not in the list (i.e. not impacted):**

  There is no restriction on the use of managed lateral and vertical guidance.

- **If the procedure is in the list (i.e. impacted):**
  USE SELECTED vertical guidance (FPA) mode only
  DO NOT USE vertical managed guidance (FINAL APP)
  DISREGARD the VDEV symbol

■ **If the operator has not established a list of impacted NPAs, or if the list is not updated with the current Navigation DataBase cycle:**
The flight crew must check if the procedure contains (refer to the MCDU example):

- Two or more FPA between the descent point and the MAP/RWY/FEP and
- An AT OR ABOVE altitude constraint coded at the FAF

- **If the above coding is not used in the procedure,**

  There is no restriction on the use of managed lateral and vertical guidance.

- **If the above coding is used in the procedure:**
  USE SELECTED vertical guidance (FPA) mode only
  DO NOT USE vertical managed guidance (FINAL APP)
  DISREGARD the VDEV symbol

Note: *1. On an impacted NPA, NAV mode may still be used for lateral guidance.*
2. For an impacted RNAV approach, the flight crew must not use the LNAV/VNAV minimum.

In all cases, the flight crew should check the approach procedure through the MCDU (*Refer to FCOM - Procedure - Normal Procedures - Standard Operating Procedures - Descent Preparation*). If during the approach, the aircraft does not follow the published vertical profile, the flight crew should revert into selected vertical guidance mode.

Continued on the following page

INCORRECT VERTICAL PROFILE DURING NON PRECISION APPROACHES (Cont'd)

CORRECTIVE ACTION

The Thales/GE FMS 2 R1A “S7” standard cancels this OEB (MOD 154301 or, 154302 or, 155031 or, 155032 and Airbus SB 22-1442 or, 22-1444).

NO ENGAGEMENT OF GUIDANCE MODE

Ident.: OEB-46-00015287.0001001 / 05 NOV 13
Applicable to: MSN 04393-04397, 04947

EXPLANATION

If a RA transmits an erroneous height indication, this may have any of the following effects on the auto flight system depending on the flight phase. However, these effects may not necessarily occur in every case of an erroneous RA height indication.

Auto Flight System mode changes (indicated on FMA):
- NAV mode engagement is not possible after takeoff,
- In case of go-around and if the RA is still frozen at a very low height indication:
  - SRS and GA TRK modes engage,
  - NAV, HDG or TRK lateral modes cannot be selected,
  - LVR CLB will not be displayed on the FMA at THR RED ALT,
  - ALT* and ALT will not engage at FCU altitude.

  Disconnecting AP and resetting both FDs enable to recover basic mode (HDG and V/S).

PROCEDURE

■ **During go-around**

● **If SRS and GA TRK modes remain engaged and other guidance modes cannot be selected or engaged as expected:**

Note: - *At the thrust reduction altitude, LVR CLB will not be displayed on the FMA,*
- *ALT* and ALT will not engage at the FCU altitude.*

Disconnect APs.
Set both FDs to OFF then ON. FDs revert to basic modes (HDG - V/S).
Re-engage guidance modes as appropriate.

■ **For the approach that follows the go-around:**
Do not arm the G/S mode.

Flight crews must report, in the technical logbook, any of the above-listed consequences of erroneous RA height.

CORRECTIVE ACTION

FG C14 or FG PC14 or FG I15 or FG PI13.

- This OEB covers a significant operational issue. Non-compliance with this OEB may have a significant impact on the operations of the aircraft. Airbus recommends that the operators apply this OEB within 30 days from the date of issue of this OEB.
- An extract of this OEB is provided for insertion in the QRH.
- Airbus recommends that all operators rapidly incorporate the corrective Service Bulletins that cancel this OEB when they become available.

Reason for issue:

This OEB is issued to provide operational recommendations in the case of a :
- HYD G ENG 1 PUMP LO PR ECAM caution followed by a HYD Y RSVR OVHT ECAM caution
- HYD Y ENG 2 PUMP LO PR ECAM caution followed by a HYD G RSVR OVHT ECAM caution

Applicable to: All A318/A319/A320/A321 Aircraft.

Cancelled by: Power Transfer Unit (PTU) inhibition logic (MOD 35938 or MOD153173)

Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.

Operations Engineering Bulletins are issued by Airbus, as the need arises, to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.
The information in the OEB is recommended by Airbus, but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

HYD ENG PUMP LO PR FOLLOWED BY HYD RSVR OVHT

Ident.: OEB-47-00015328.0001001 / 20 DEC 13
Applicable to: MSN 01767-01920, 02108, 02204, 02405-02482, 02649, 02908

REASON FOR ISSUE

A fluid leakage from the green (yellow) hydraulic system causes a decrease in hydraulic pressure. When the difference in pressure between the green and yellow systems reaches 500 PSI, the PTU is automatically activated to transfer hydraulic power between the two systems. However, due to the fluid leakage, the PTU cannot pressurize the green (yellow) system and starts to run at high speed, heating up the hydraulic fluid in the yellow (green) hydraulic system. This results in an overheat of the yellow (green) hydraulic reservoir and the associated ECAM caution triggers. When the flight crew applies the successive ECAM procedures, both yellow and green hydraulic systems are lost and the Flight Warning Computer (FWC) triggers the HYD G+Y SYS LO PRECAM warning.
The purpose of this OEB is to inform operators about the operational effect of such a failure, and to provide an operational procedure to prevent a dual hydraulic system loss in the described conditions.

EXPLANATION

The main cause of these dual hydraulic loss events is a fluid leakage from the green hydraulic system during landing gear retraction. The decrease in pressure due to this leakage triggers the HYD G ENG 1 PUMP LO PRECAM caution and automatically activates the PTU . However, because of the leakage, the PTU operates at high speed due to its inability to pressurize the green hydraulic system. This causes the yellow hydraulic reservoir to overheat, and the FWC to trigger the HYD Y RSVR OVHTECAM caution.
The ECAM HYD G ENG 1 PUMP LO PR and HYD Y RSVR OVHT procedures specify to set their respective pumps to off. When the flight crew applies these procedures, this results in a loss of the yellow and green hydraulic systems and a HYD G+Y SYS LO PRECAM warning.
During the initial climb, the HYD G RSVR LO LVLECAM caution is inhibited. Therefore the action requested by this procedure to turn off the PTU may appear when the overheat is already present.
A similar scenario may occur, in the case of a slow fluid leakage from the green (yellow) hydraulic system.
In all cases, the HYD Y(G) RSVR OVHTECAM caution is triggered between 2 to 10 min after the triggering of the HYD G(Y) ENG 1(2) PUMP LO PRECAM caution.

Continued on the following page

HYD ENG PUMP LO PR FOLLOWED BY HYD RSVR OVHT (Cont'd)

PROCEDURE

- **If a HYD G ENG 1 PUMP LO PR ECAM caution is followed by a HYD Y RSVR OVHT ECAM caution, disregard the HYD Y RSVR OVHT ECAM procedure, and apply the following procedure to stop the overheat situation:**

HYD Y RSVR OVHT
PTU..... OFF
YELLOW ENG 2 PUMP..... KEEP ON

- **If a HYD Y ENG 2 PUMP LO PR ECAM caution is followed by a HYD G RSVR OVHT ECAM caution, disregard the HYD G RSVR OVHT ECAM procedure, and apply the following procedure to stop the overheat situation:**

HYD G RSVR OVHT
PTU..... OFF
GREEN ENG 1 PUMP..... KEEP ON

CORRECTIVE ACTION

Installation of the automatic PTU inhibition logic as per MOD 35938 (SB A320–29–1126, or SB A320–29–1145), or MOD 153173 (SB A320–29–1156) cancels this OEB. The PTU inhibition logic detects a low pressure situation for more than 6 s of the green or yellow hydraulic system and, consequently, automatically turns off the PTU. This prevents PTU high speed situation and subsequent hydraulic system overheat.

OEB54 Issue 2
Associated with QRH OEB Proc N°: OEB54/1.0
INCORRECT FAC WEIGHT DUE TO DASHED CG ON FUEL PRED PAGE

Ident.: OEB-54-00021290.0001001 / 03 SEP 18
Applicable to: MSN 05829, 05898

Approved by: Head of Airbus Flight Operations & Training Support

- This OEB covers a significant operational issue. Non-compliance with this OEB may have a significant impact on the safe operations of the aircraft. The operators shall distribute its content to all flight crews without delay.
- An extract of this OEB is provided for insertion in the QRH.
- Airbus recommends that all operators rapidly incorporate the corrective Service Bulletins that cancel this OEB when they become available.

Reason for issue:

Issue 02:
This OEB is revised in order to update the "Cancelled by" section.
Issue 01:
This OEB is issued to provide a procedure in case both FMS display dashed CG on the FUEL PRED page.

Applicable to:

This OEB is applicable to following aircraft fitted with Thales FMS and FAC standard previous to CAA06:
- A318
- A319/A320/A321ceo fitted with sharklets
- A320neo family
- A319/A320/A321ceo with SB 22-1229 that activates the characteristic speeds computation based on FMS data.

Cancelled by:

This OEB is cancelled by either of the following:

- FAC standard CAA06 (MOD 161931, MP P15872, SB 22-1593 or 22-1594), or
- FAC standard B0625 (MOD 163264, MP P20731, SB 22-1644), or
- Thales FMS2 Release 1A "S7B" standard (MOD 159501 / MP P20078 / SB 22-1590 or MOD 159502 / MP P20079 / SB 22-1591 or MOD 160655 / MP P20384 or MOD 160658 / MP P20386).

Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.

Operations Engineering Bulletins are issued by Airbus, as the need arises, to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.
The information in the OEB is recommended by Airbus, but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

INCORRECT FAC WEIGHT DUE TO DASHED CG ON FUEL PRED PAGE

Ident.: OEB-54-00021524.0001001 / 03 SEP 18
Applicable to: MSN 05829, 05898

EXPLANATION

The FMS aircraft weight (GW) and CG enable the FAC to compute and display the characteristic speeds (VLS/S/F/GD) on both PFDs.
If the FMS sends an invalid CG to the FAC, the FAC considers both GW and CG as invalid. In this case, the FAC GW that is used to compute the characteristic speeds is initialized with the latest stored valid FMS GW updated with a fuel consumption model. The resulting FAC GW may not reflect the current aircraft weight at takeoff. As a consequence, the characteristic speeds that are displayed on the PFD may be erroneous.

An FMS CG invalidity at engine start may result from either of the following:

- A system malfunction,
- An erroneous insertion of the block fuel or taxi fuel on FMS,
- No insertion of the ZFWCG on FMS.

If the FMS CG is invalid, the CG field is dashed on the FUEL PRED page. This OEBenables the flight crew to detect and correct the FMS CG invalidity by checking, after engine start, the CG field on the FUEL PRED page.

Continued on the following page

INCORRECT FAC WEIGHT DUE TO DASHED CG ON FUEL PRED PAGE (Cont'd)

PROCEDURE

This procedure must be performed on ground only.
The GW CG value must be displayed at least on one FMS to resume normal operations.

AFTER ENGINE START (AT LEAST ONE ENGINE)

CG on FUEL PRED page (FMS1 or 2)..... CHECK

Check that FMS1 or 2 FUEL PRED page displays a GW CG value.

- **If GW CG dashed:**
  ZFWCG value..... ENTER/RE-ENTER
  CG on FUEL PRED page (after 5 s)..... CHECK
  - **If GW CG field remains dashed on both FMS:**
    MAINTENANCE ACTION IS DUE

DEFINITIONS

Ident.: PER-LOD-GEN-00001661.0001001 / 09 DEC 09
Applicable to: ALL

MANUFACTURER'S EMPTY WEIGHT (MEW)

The weight of the structure, power plant, furnishings, systems and other items of equipment that are considered as integral part of the aircraft. It is essentially a "dry" weight, including only those fluids contained in closed systems (e.g. hydraulic fluid).

OPERATIONAL EMPTY WEIGHT (OEW)

The manufacturer's weight empty plus the operator's items i.e. the flight and cabin crew and their baggage, unusable fuel, engine oil, emergency equipment, toilet chemicals and fluids, galley structure, catering equipment, seats, documents etc.

DRY OPERATING WEIGHT (DOW)

The total weight of an aircraft ready for a specific type of operation excluding all usable fuel and traffic load.
Operational Empty Weight plus items specific to the type of flight i.e. catering, newspapers, pantry equipment etc.

TAKEOFF FUEL

The weight of the fuel onboard at takeoff.

OPERATING WEIGHT

The weight obtained by addition of the operational empty weight and the takeoff fuel.

TOTAL TRAFFIC LOAD

The weight of the payload including cargo loads, passengers and passengers bags.

ZERO FUEL WEIGHT (ZFW)

The weight obtained by addition of the total traffic load and the dry operating weight.

TAKEOFF WEIGHT (TOW)

The weight at takeoff. It is equal to the addition of the zero fuel weight and takeoff fuel.

TRIP FUEL

The weight of the fuel necessary to cover the normal leg without reserves.

LANDING WEIGHT

The weight at landing. It is equal to takeoff weight minus trip fuel.

Intentionally left blank

TO DETERMINE FUEL QUANTITY IN THE WING TANK

MMI (from number 4 to number 2)..... UNLOCK and WITHDRAW

The crewmember must slowly withdraw the MMI, until magnetic attraction is felt between the rod and float magnets.

Do not use force when withdrawing the MMI, as this will disengage the float magnet from the rod magnet, and bring the rod down on to the mechanical stop.

ROD GRADUATION (which aligns with bottom wing surface)..... READ

MMIs shall be withdrawn from number 4 to number 2 until one MMI measures fuel.

MMI..... IN PLACE and LOCKED

Enter the table for the applicable aircraft wing side, aircraft attitude (grid square letter and number), and the applicable MMI stick number, to find the volume of fuel in the wing tank (See below).

Multiply the result by the specific gravity to find the fuel weight.

Note: The manual magnetic indication accuracy is around 5 %.

Ident.: PER-LOD-FUL-C-00001680.0001001 / 13 JAN 14

Applicable to: MSN 01767-03782

TO DETERMINE FUEL QUANTITY IN THE INNER TANK

MMI (from number 4 to number 1)..... UNLOCK and WITHDRAW

The crewmember must withdraw the MMI slowly until he feels the magnetic attraction between the rod and float magnets.

Do not use force when withdrawing the MMI as this will disengage the float magnet from the rod magnet and bring the rod down onto the mechanical stop.

ROD GRADUATION (which aligns with bottom wing surface)..... READ

MMI..... IN PLACE and LOCKED

MMIs shall be withdrawn from number 4 to number 1 until one MMI measures fuel.

Use the table for the applicable aircraft wing side, aircraft attitude (grid square letter and number), and the applicable MMI stick number to find the volume of fuel in the inner tank (Refer to FCOM - PER.LOD.FUL FUEL. C.USE OF MANUAL MAGNETIC INDICATORS (MMI) - WING TANKS).

Multiply the result by the specific gravity to find the fuel weight.

Note: The manual magnetic indication accuracy is around 5 %.

GENERAL

Ident.: PER-LOD-WBA-LTS-00001685.0001001 / 09 DEC 09
Applicable to: ALL

This chart allows the determination of Aircraft CG location (MAC) function of dry operating weight, pantry adjustment, cargo loads, passengers and fuel on board.
The operational limits shown on the load and trim sheet are more restrictive than the certified limits because error margins have been taken into account.

The load and trim sheet needs to be updated when :
- a modification which changes the aircraft certified limits is included or
- a modification (cabin layout, cargo arrangement ...) which influences the operational limits is made.

It is the airline responsibility to define a load and trim sheet and to keep it up to date. *Refer to PER-LOD-WBA-LTS DESCRIPTION* is a description of the Load and Trim Sheet utilization (*Refer to PER-LOD-WBA-LTS LOAD AND TRIM SHEET*), for a typical passenger arrangement.
Refer to customized load and trim sheet for preparing a revenue flight.

DATA

Ident.: PER-LOD-WBA-LTS-00001686.0002001 / 23 JUN 15
1 **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

Dry Operating Weight = 42 500 kg and CG = 27 % (H-arm = 18.93 m)
Deviation or adjustment = +100 kg in zone F
Cargo = 5 500 kg with the following distribution:
cargo 1 = 2 000 kg; cargo 3 = 1 500 kg; cargo 4 = 1 500 kg; cargo 5 = 500 kg
Passengers = 145 PAX with the following distribution:
cabin OA = 50; cabin OB = 55; cabin OC = 40
Ramp Fuel = 13 200 kg; Taxi Fuel = 200 kg; Fuel Density = 0.785 kg/l

DATA

Ident.: PER-LOD-WBA-LTS-00001686.0004001 / 23 JUN 15

[2] **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

Dry Operating Weight = 48 000 kg and CG = 22 % (H-arm = 23 m)
Deviation or adjustment = +100 kg in zone F
Cargo = 6 500 kg with the following distribution:
cargo 1 = 1 000 kg; cargo 2 = 0 kg; cargo 3 = 3 000 kg; cargo 4 = 2 000 kg; cargo 5 = 500 kg
Passengers = 180 PAX with the following distribution:
cabin OA = 50; cabin OB = 70; cabin OC = 60
Ramp Fuel = 14 200 kg
Taxi Fuel = 200 kg
Fuel Density = 0.785 kg/l

DESCRIPTION

Ident.: PER-LOD-WBA-LTS-00001687.0002001 / 12 FEB 11

[3] **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

a. Enter Master data in (1).
b. Compute Dry Operating Weight Index using the formula indicated in (2) and report in (3).
c. Dry Operating Index = 53.4.
d. Enter weight deviation or adjustment in (4) and read corresponding index variation in (5): +1.43.
e. Calculate corrected index and report in (6): 54.83.
f. Enter master data in table (7) and determine Zero Fuel Weight: 60 280 kg and Takeoff Weight: 73 280 kg.
g. Enter cargo weight and passenger number per compartment in (8).
h. Enter index scale (9) with corrected index and proceed through cargo and passenger scales (10).
i. From the final point draw a vertical line which intersects (12) the zero fuel weight horizontal line (11).
j. Check if the intersection point is within the Zero Fuel Weight operational limits, if not rearrange cargo loading.
k. Read in table (13) the fuel index correction corresponding to Ramp Fuel Weight (13 200 kg) and Fuel Density (0.785 kg/l).
   This example will be continued assuming the FUEL INDEX = –2 was found. Carry in fuel scale (14).
l. From this point draw a vertical line which intersects (16) the takeoff weight horizontal line (15).
m. Check if the intersection point is within the Takeoff Weight operational limits.
n. Read zero fuel weight and CG position: 32.7 % and fill in table (17).
o. Read takeoff CG position: 30.5 % and fill in table (18).

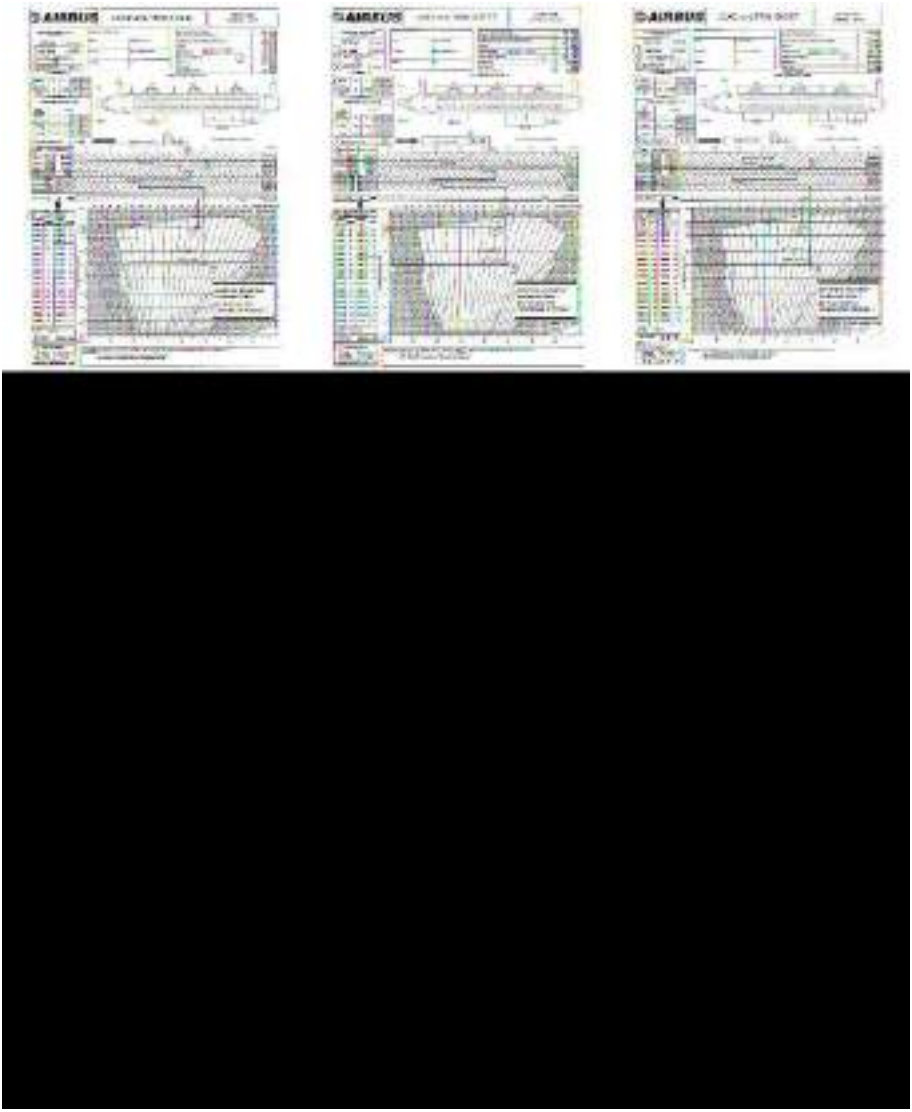
CAUTION	If there is no customized trim sheet for your airline in this section, do not use the information enclosed herein for day to day operation as margins and load CG vary with cabin and cargo layout.

Note: *When referring to CG lower than 27 %, an operational margin is taken into account. It is the reason why performance at forward CG (lower than 25 %) must be used for operational CG lower than 27 %.*

DESCRIPTION

Ident.: PER-LOD-WBA-LTS-00001687.0004001 / 12 FEB 11

4 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**



a. Enter Master data in (1).
b. Compute Dry Operating Weight Index using the formula indicated in (2) and report in (3).
c. Dry Operating Index = 43.96.
d. Enter weight deviation or adjustment in (4) and read corresponding index variation in (5): +1.70.
e. Calculate corrected index and report in (6): 45.66.
f. Enter master data in table (7) and determine Zero Fuel Weight: 69 720 kg and Takeoff Weight: 83 720 kg.
g. Enter cargo weight and passenger number per compartment in (8).
h. Enter index scale (9) with corrected index and proceed through cargo and passenger scales (10).
i. From the final point draw a vertical line which intersects (12) the zero fuel weight horizontal line (11).
j. Check if the intersection point is within the Zero Fuel Weight operational limits, if not rearrange cargo loading.
k. Read in table (13) the fuel index correction corresponding to Ramp Fuel Weight (14 200 kg) and Fuel Density (0.785 kg/l).
   This example will be continued assuming the FUEL INDEX = –5 was found.
   Carry in fuel scale (14).
l. From this point draw a vertical line which intersects (16) the takeoff weight horizontal line (15).
m. Check if the intersection point is within the Takeoff Weight operational limits.
n. Read zero fuel weight and CG position: 31.6 % and fill in table (17).
o. Read takeoff CG position: 29 % and fill in table (18).

CAUTION	If there is no customized trim sheet for your airline in this section, do not use the information enclosed herein for day to day operation as margins and load CG vary with cabin and cargo layout.

FUEL INDEX TABLE

GENERAL

Ident.: PER-LOD-WBA-FIT-10-00012775.0018001 / 16 OCT 18

1 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

The standard tools such as the load and trim sheet used to compute the CG assume the fuel distribution is normal as per the automatic fueling system features.
If for any reason, (e.g. dispatch through MMEL with one item inoperative) after refueling the actual fuel distribution deviates from the normal fuel distribution in the tanks, the actual and the trim sheet CG will show a discrepancy. The following tables allow to determine the fuel index taking into account the actual fuel quantity in each tank. To determine the actual takeoff CG enter the tables with the actual fuel quantities in each tank, read the fuel index for each tank and use their sum to enter the trim sheet. Check that the actual CG is inside the operational limits. If the CG is outside the limits transfer fuel to achieve a distribution in accordance with the chart or rearrange the load.

Note: *These tables are valid only when used with the following formula for the index:*
I = W x (H-arm – 23.117)/1 000 + K or I = [(CG – 25) x W x 0.000042] + K
(Weight in kg, H-arm in m)

DATA : Fuel in left wing fuel tank = 5 000 kg
Fuel in right wing fuel tank = FULL
Fuel in center tank = FULL
Fuel in AFT 1 = 2 000 kg
Fuel in AFT 2 = 0 kg
Fuel in FWD = 0 kg

		Weight	Index	
Wing tank	**Left**	5 000	-	3
	Right	6 000	-	1
Center tank		6 350	-	10
AFT 1		2 000	+	9
AFT 2		0		0
FWD		0		0
TOTAL		19 350	-	5

Enter the trim sheet with a fuel index of -5.

GENERAL

Ident.: PER-LOD-WBA-FIT-10-00012775.0002001 / 21 MAR 17

[2] **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

The fuel index table has been established assuming a fuel distribution in accordance with refuel distribution given in section *Refer to DSC-28-10-70 Refueling - Defueling* of this volume.
If after refueling the actual distribution deviates from the chart values, the actual and the trim sheet CG will show a discrepancy. The following tables allow to determine the fuel index taking into account the actual fuel quantity in each tank. To determine the actual takeoff CG enter the tables with the actual fuel quantities in each tank, read the fuel index for each tank and use their sum to enter the trim sheet. Check that the actual CG is inside the operational limits. If the CG is outside the limits transfer fuel to achieve a distribution in accordance with the chart or rearrange the load.

Note: *These tables are valid only when used with the following formula for the index:*
I = W x (H-arm – 18.85)/1 000 + K or I = [(CG – 25) x W x 0.000042] + K
(Weight in kg, H-arm in m)

DATA : Fuel in left inner fuel tank = 4 500 kg
Fuel in right inner fuel tank = 4 500 kg
Fuel in left outer fuel tank = 200 kg
Fuel in right outer fuel tank = FULL
Fuel in center tank = 0 kg

		Weight	Index	
Inner tank	**Left**	4 500	-	3
	Right	4 500	-	3
Outer tank	**Left**	200		0
	Right	691	+	2
Center tank		0		0
TOTAL		9 891	-	4

Enter the trim sheet with a fuel index of –4

Applicable to: ALL

The ground distance/air distance conversion tables show the air distance for a given ground distance due to the influence of the wind.

The Tables are given for :
- M .78
- Long range speed.

M.78

GENERAL

Ident.: PER-THR-GEN-00004079.0001001 / 28 FEB 11
Applicable to: ALL

The thrust rating charts have been established for:

- Maximum takeoff
- Maximum go around
- Flexible takeoff
- Maximum continuous
- Maximum climb
- Maximum cruise

Intentionally left blank

DEFINITION

Ident.: PER-THR-MTO-00001968.0001001 / 01 MAR 11
Applicable to: ALL

It is the maximum thrust certified for takeoff and is normally limited to five minutes.
This time is extended to ten minutes for engine out contingency, as authorized by the approved AFM.

MAXIMUM TAKEOFF

Ident.: PER-THR-MTO-00001969.0033001 / 20 DEC 16

1 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

MAXIMUM GO AROUND

Ident.: PER-THR-MGA-00001972.0005001 / 28 JAN 11

[3] **Applicable to: MSN 01957-02359, 02405-02482, 02609-02670, 02737-03071, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-06336**

DEFINITION

Ident.: PER-THR-FLX-00001973.0002001 / 23 FEB 11

[1] **Applicable to: MSN 01957-02359, 02405-02482, 02609-02670, 02737-03071, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-06336**

It is a reduced takeoff thrust as compared to the maximum permissible. The related EPR is calculated as a function of the flexible temperature entered in the FMGS MCDU. The flexible temperature is a function of the aircraft weight and environmental conditions.
It guarantees that the regular performance requirements are met.

DEFINITION

Ident.: PER-THR-FLX-00001973.0001001 / 23 FEB 11

[2] **Applicable to: MSN 01767-01920, 02388, 02584, 02712, 03138, 03750, 04294, 04314, 04393-04438, 04510, 06720-09063**

It is a reduced takeoff thrust as compared to the maximum permissible. The related N1 is calculated as a function of the flexible temperature entered in the FMGS MCDU. The flexible temperature is a function of the aircraft weight and environmental conditions.
It guarantees that the regular performance requirements are met.

1 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

It is the maximum thrust approved for normal cruise.
There is no thrust lever position corresponding to this thrust rating.
It is not displayed to the pilot, and the N1 limit which is displayed in cruise is the maximum climb N1.
The FMGS uses the maximum cruise N1 to compute the aircraft maximum speed.

In manual thrust setting, in cruise, the flight crew should limit N1 to the maximum cruise N1 that is equal to:

- The maximum climb N1 that is displayed minus 2.4 % when the aircraft is below 31 000 ft,
- The maximum climb N1 that is displayed minus 2.9 % when the aircraft is at or above 31 000 ft.

DEFINITION

Ident.: PER-THR-MCR-00001979.0010001 / 09 NOV 17

2 **Applicable to: MSN 06720-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

It is the maximum thrust approved for normal cruise.
There is no thrust lever position corresponding to this thrust rating.
It is not displayed to the pilot, and the N1 limit which is displayed in cruise is the maximum climb N1.
The FMGS uses the maximum cruise N1 to compute the aircraft maximum speed.

In manual thrust setting, in cruise, the flight crew should limit N1 to the maximum cruise N1 that is equal to:

- The maximum climb N1 that is displayed minus 2.1 % when the aircraft is below 31 000 ft,
- The maximum climb N1 that is displayed minus 2.3 % when the aircraft is at or above 31 000 ft.

DEFINITION

Ident.: PER-THR-MCR-00001979.0002001 / 02 FEB 11

3 **Applicable to: MSN 01957-02359, 02405-02482, 02609-02670, 02737-03071, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-06336**

It is the maximum thrust approved for normal cruise.
There is no thrust lever position corresponding to this thrust rating.
It is not displayed to the pilot, and the EPR limit which is displayed in cruise is the maximum climb EPR.
The FMGS uses the maximum cruise EPR to compute the aircraft maximum speed.
In manual thrust setting, in cruise, the pilot should limit EPR to the maximum cruise EPR that is equal to the displayed maximum climb EPR minus 0.07.

DEFINITION

Ident.: PER-THR-MCR-00001979.0004001 / 02 FEB 11
Applicable to: MSN 01767-01920, 02388, 02584, 02712, 03138, 03750, 04294, 04314, 04393-04438, 04510

It is the maximum thrust approved for normal cruise.
There is no thrust lever position corresponding to this thrust rating.
It is not displayed to the pilot, and the N1 limit which is displayed in cruise is the maximum climb N1.
The FMGS uses the maximum cruise N1 to compute the aircraft maximum speed.
In manual thrust setting, in cruise, the pilot should limit N1 to the maximum cruise N1 that is equal to the displayed maximum climb N1 minus 1.9 %.

N1 MODE THRUST CONTROL

Ident.: PER-THR-N1-00004648.0010001 / 21 MAR 16

[1] **Applicable to: MSN 01957-02359, 02405-02482, 02609-02670, 02737-03071, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-06336**

In case of no EPR available, the thrust control automatically reverts to N1 mode (rated or degraded).
Refer to PRO-ABN-ENG ENG 1(2) EPR MODE FAULT (First Threshold).
If the rated N1 mode is lost on both engines, refer to the power management tables given on the following pages.
The herebelow table gives the N1 to be set in cruise to maintain M 0.78.

	FLIGHT LEVEL					
WEIGHT (1000 KG)	**290**	**310**	**330**	**350**	**370**	**390**

DEFINITION OF FLEXIBLE TAKEOFF

DEFINITION OF FLEXIBLE TAKEOFF

Ident.: PER-TOF-THR-FLX-10-00001718.0001001 / 28 JAN 11
Applicable to: ALL

In many cases the aircraft takes off with a weight lower than the maximum permissible takeoff weight. When this happens, it can meet the required performance (runway, second segment, obstacle,...) with a decreased thrust that is adapted to the weight : this is called FLEXIBLE TAKEOFF and the thrust is called FLEXIBLE TAKEOFF THRUST.
The use of flexible takeoff thrust saves engine life.

Intentionally left blank

USE OF FLEXIBLE TAKEOFF

USE OF FLEXIBLE TAKEOFF

Ident.: PER-TOF-THR-FLX-20-00001719.0001001 / 09 DEC 09
Applicable to: ALL

The pilot can use flexible takeoff when the actual takeoff weight is lower than the maximum permissible takeoff weight for the actual temperature. The maximum permissible takeoff weight decreases when temperature increases, so it is possible to assume a temperature at which the actual takeoff weight would be the limiting one. This temperature is called FLEXIBLE TEMPERATURE or assumed temperature and is entered in the FADEC via the MCDU PERF TO page in order to get the adapted thrust.

Intentionally left blank

REQUIREMENTS

REQUIREMENTS

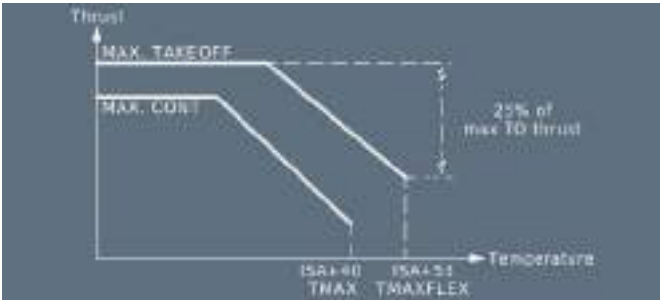
Ident.: PER-TOF-THR-FLX-30-00001792.0047001 / 07 FEB 17

1 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

- Thrust must not be reduced by more than 25 % of the full rated takeoff thrust.
- The flexible takeoff N1 cannot be lower than the Max climb N1 at the same flight conditions.
  The FADEC takes the above two constraints into account to determine flexible N1.
  The above two constraints also limit the maximum flexible temperature at ISA + 49 (64 °C at sea level).
- The flexible temperature cannot be lower than the flat rating temperature, TREF (ISA +15 at sea level), or the actual temperature (OAT).
- Flexible takeoff is not permitted on contaminated runways.
- The operator should check the maximum thrust (TOGA) at regular intervals in order to detect any engine deterioration, or maintain an adequate engine performance monitoring program to follow up the engine parameters.

REQUIREMENTS

Ident.: PER-TOF-THR-FLX-30-00001792.0046001 / 12 MAY 16



2 **Applicable to: MSN 06720-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

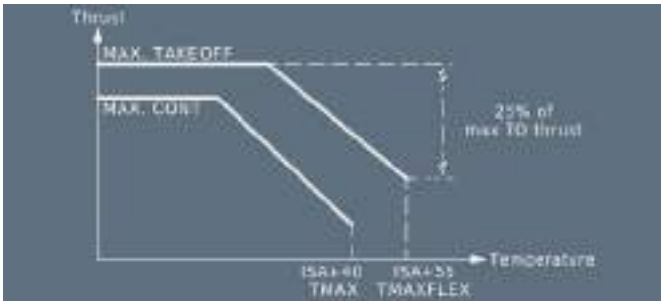
- Thrust must not be reduced by more than 25 % of the full rated takeoff thrust.
- The flexible takeoff N1 cannot be lower than the Max climb N1 at the same flight conditions.
  The FADEC takes the above two constraints into account to determine flexible N1.
  The above two constraints also limit the maximum flexible temperature at ISA + 50 (65 °C at sea level).
- The flexible temperature cannot be lower than the flat rating temperature, TREF (ISA +32 at sea level), or the actual temperature (OAT).
- Flexible takeoff is not permitted on contaminated runways.
- The operator should check the maximum thrust (TOGA) at regular intervals in order to detect any engine deterioration, or maintain an adequate engine performance monitoring program to follow up the engine parameters.

REQUIREMENTS

Ident.: PER-TOF-THR-FLX-30-00001792.0017001 / 15 MAR 11
Applicable to: MSN 01767-01920, 02388, 02584, 02712, 03138, 03750, 04294, 04314, 04393-04438, 04510

- Thrust must not be reduced by more than 25 % of the full rated takeoff thrust.
- The flexible takeoff N1 cannot be lower than the Max climb N1 at the same flight conditions.
  The FADEC takes the above two constraints into account to determine flexible N1.
  The above two constraints also limit the maximum flexible temperature at ISA+ 53 (68 °C at sea level).
- The flexible takeoff thrust cannot be lower than the Max Continuous thrust used for the final takeoff flight path computation (at ISA +40).
- The flexible temperature cannot be lower than the flat rating temperature, TREF (ISA +29 up to 2 000 ft) (See Note), or the actual temperature (OAT).

Note: *TREF being a function of pressure altitude, read it on the takeoff chart.*



- Flexible takeoff is not permitted on contaminated runways.
- The operator should check the maximum thrust (TOGA) at regular intervals in order to detect any engine deterioration, or maintain an adequate engine performance monitoring program to follow up the engine parameters.

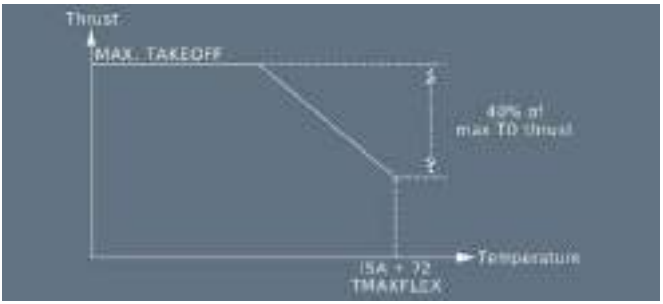
REQUIREMENTS

Ident.: PER-TOF-THR-FLX-30-00001792.0013001 / 04 JUL 17

Applicable to: MSN 02108, 02135, 02139-02359, 02405-02482, 02609-02670, 02737-02914, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04488, 04506, 04518, 04535-04637, 04752-05094, 05155-05190, 05230-06336

- Thrust must not be reduced by more than 25 % of the full rated takeoff thrust.
- The flexible takeoff EPR cannot be lower than the Max climb EPR at the same flight conditions.
  The FADEC takes the above two constraints into account to determine flexible EPR.
  The above two constraints also limit the maximum flexible temperature at ISA + 55 (70 °C at sea level).
- The flexible takeoff thrust cannot be lower than the Max Continuous thrust used for the final takeoff flight path computation (at ISA +40).
- The flexible temperature cannot be lower than the flat rating temperature, TREF (ISA+31 at sea level or See Note), or the actual temperature (OAT).

Note: TREF being a function of pressure altitude, read it on the takeoff chart.



- Flexible takeoff is not permitted on contaminated runways.
- The operator should check the maximum thrust (TOGA) at regular intervals in order to detect any engine deterioration, or maintain an adequate engine performance monitoring program to follow up the engine parameters.

REQUIREMENTS

Ident.: PER-TOF-THR-FLX-30-00001792.0026001 / 04 JUL 17

3 **Applicable to: MSN 01957-02097, 02121, 02138, 03071, 04491, 04532, 04645, 05120, 05218**

- Thrust must not be reduced by more than 40 % of the full rated takeoff thrust.
- The flexible takeoff EPR cannot be lower than the Max climb EPR at the same flight conditions.
  The FADEC takes the above two constraints into account to determine flexible EPR.
  The above two constraints also limit the maximum flexible temperature at ISA + 72 (87 °C at sea level).
- The flexible temperature cannot be lower than the flat rating temperature, TREF (ISA+31 at sea level or See Note), or the actual temperature (OAT).

Note: *TREF being a function of pressure altitude, read it on the takeoff chart.*

- Flexible takeoff is not permitted on contaminated runways.
- The operator should check the maximum thrust (TOGA) at regular intervals in order to detect any engine deterioration, or maintain an adequate engine performance monitoring program to follow up the engine parameters.

RECOMMENDATION

GENERAL

Ident.: PER-TOF-THR-FLX-40-00001720.0002001 / 15 DEC 15
Applicable to: ALL

- In order to extend engine life and save maintenance costs, it is recommended to use flexible thrust reduction.
- However, to improve the takeoff performance, the thrust can be increased by selecting a lower flexible temperature.

Using the same takeoff chart, for a given weight it is possible to :
- Select a temperature lower than the maximum determined one and keep the speeds defined at maximum temperature or,
- Move towards the left side (tailwind) of the takeoff chart while remaining within the same configuration and looking for the same actual takeoff weight at lower temperature.
  This produces a lower flexible temperature and, in general, lower takeoff speeds (V1/VR/V2).

Using one of the two above possibilities, check that the selected temperature is greater than the actual temperature (OAT) and greater than the flat rating temperature (TREF).

TAKEOFF PROCEDURE

Ident.: PER-TOF-THR-FLX-40-00001721.0001001 / 28 JAN 11
Applicable to: ALL

Depending on environmental takeoff conditions, the following procedure is recommended.

CONDITIONS	PROCEDURE	REASON
Dry or wet well paved runway	- Use the flap setting giving the highest flexible temperature. - When flexible temperature difference between two flap settings is low, use the highest flap setting.	Extend engine life and save maintenance costs.
High altitude takeoff	Use CONF2/CONF3	Improve comfort
Badly paved runway or Accelerate stop distance limited runway	Use CONF2/CONF3 or Move towards left side of the takeoff chart	Improve comfort Improve stopping distance
Windshear expected along takeoff path	Use maximum thrust	Maintain acceleration capability
Contaminated runway	Use maximum thrust (flex forbidden)	Improve stopping distance Decrease time on runway. Required by regulations.

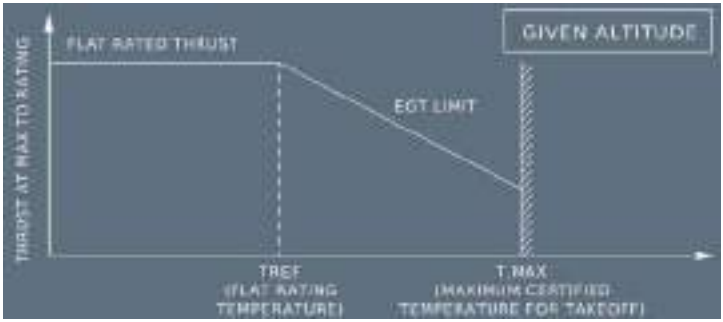
TAKEOFF CHARTS

Ident.: PER-TOF-TOC-05-00001704.0001001 / 21 MAR 11
Applicable to: ALL

Takeoff charts are required to provide performance at takeoff. It is possible to present the charts in two different ways, one of which is selected by the airline. The different presentations are :

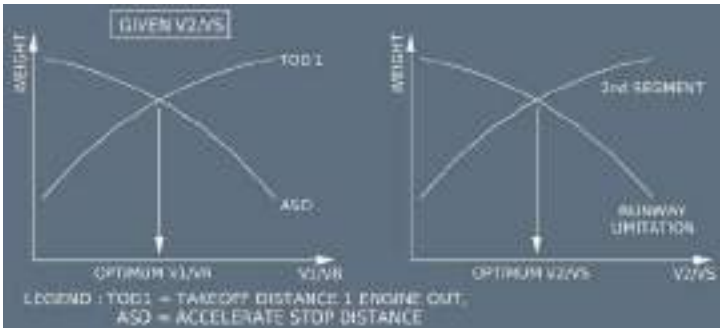
- temperature entry (temperature provided in the left column)
- weight entry (weight provided in the left column).

Both presentations are described here after. Sections PER-TOF-TOC-10, 12 and 14 are relative to temperature entry while PER-TOF-TOC-16, 18 and 20 are relative to weight entry.



Intentionally left blank

TAKEOFF PERFORMANCE



TAKEOFF PERFORMANCE

Ident.: PER-TOF-TOC-10-10-00001705.0001001 / 23 FEB 11
Applicable to: ALL

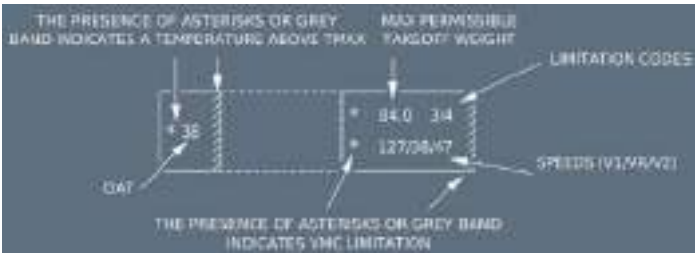
Takeoff optimization is calculated for a given runway and its obstacles and for given conditions of flap setting, temperature, wind and QNH. The calculation produces a maximum permissible takeoff weight (or a maximum takeoff temperature for an actual weight).
The takeoff thrust produced by the engine varies as follows :

The optimization process calculates the speeds which will produce the maximum takeoff weight. To do so, it takes into account the different takeoff limitations such as TOD, ASD, TOR, second segment..., as shown on the figure charts below.

On a typical runway, the performance of a twin engine aircraft, is generally limited by the one engine out operation at takeoff. The optimum V2/VS and optimum V1/VR are consequently unique.

Intentionally left blank

TAKEOFF CHART DESCRIPTION



GENERAL

Ident.: PER-TOF-TOC-10-20-00001706.0003001 / 03 MAR 11
Applicable to: ALL

The takeoff chart (RTOW : Regulatory Takeoff Weight) is calculated for a specific aircraft version and for a particular runway specified at the top of the chart. The top of the chart also gives some information about the runway and lists the calculation assumptions.

The chart is given for 2 different configurations and 5 wind values per configuration. This allows the crew to select the configuration that gives either :
- the highest permissible takeoff weight, or, for a given weight,
- the highest flexible temperature.

If different configurations give equivalent performance, the crew should select the configuration associated with the lowest takeoff speeds.
For each temperature value (and for a given configuration and wind), the chart provides the following information :

The available limitation codes are :

- First segment	:	1
- Second segment	:	2
- Runway length	:	3
- Obstacles	:	4
- Tire speed	:	5
- Brake energy	:	6
- Maximum computation weight	:	7
- Final takeoff	:	8
- VMU	:	9

CORRECTIONS DUE TO DIFFERENT TAKEOFF CONDITIONS

Ident.: PER-TOF-TOC-10-20-00014608.0001001 / 18 JUL 12

1 **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

Each takeoff chart is computed for a given set of conditions (air conditioning, QNH, anti ice...) specified at the top of the chart. If the actual takeoff conditions are different, the crew must apply corrections. Two types of correction are available :

- Conservative corrections on *Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS* (to be used when not provided on the chart).
- Corrections (less restrictive) listed on the chart, to be applied as explained below.

Note: - *If the RTOW chart is based on the CG being at 25 %, the crew can find the takeoff performance at a more forward CG by decreasing the takeoff weight by 1 000 kg (2 200 lb) and increasing V1, VR and V2 by 1 kt.*
- *25 % CG is the basic certified limit, on which all takeoff computations are based. To take into account the operational margins, the above penalties must be applied when operational CG is forward 27 % CG.*

CORRECTIONS DUE TO DIFFERENT TAKEOFF CONDITIONS

Ident.: PER-TOF-TOC-10-20-00014608.0002001 / 18 JUL 12

2 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

Each takeoff chart is computed for a given set of conditions (air conditioning, QNH, anti ice...) specified at the top of the chart. If the actual takeoff conditions are different, the crew must apply corrections. Two types of correction are available :

- Conservative corrections on *Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS* (to be used when not provided on the chart).
- Corrections (less restrictive) listed on the chart, to be applied as explained below.

DESCRIPTION OF THE CORRECTIONS ON TAKEOFF CHART

Ident.: PER-TOF-TOC-10-20-00005368.0001001 / 08 JUL 15
Applicable to: ALL

The corrections are presented on 4 lines:

TVMC is a temperature value given per column. This is a fictitious value that indicates the temperature above which the speeds are close to a VMCG/VMCA limitation or are VMCG/VMCA limited.

Note: The lower two lines may be shaded on certain chart formats.

MINIMUM SPEEDS

Ident.: PER-TOF-TOC-10-20-00005372.0001001 / 08 JUL 15
[3] **Applicable to: MSN 01767-08864, 08901, 09063**

Minimum V1/VR/V2 due to VMCG/VMCA are provided on the bottom right side of the takeoff chart. They are only applicable in case of speed corrections.
These speeds are conservative. They may be slightly higher than V1/VR/V2 displayed on the takeoff chart.

FLEX TEMPERATURE INDICATOR

Ident.: PER-TOF-TOC-10-20-00005373.0001001 / 18 FEB 11
Applicable to: ALL

On the temperature entry chart, the temperature column may display asterisks or have a gray band to indicate temperature values above TMAX and which are flex temperature.

Intentionally left blank

ADDITIONAL INFORMATION

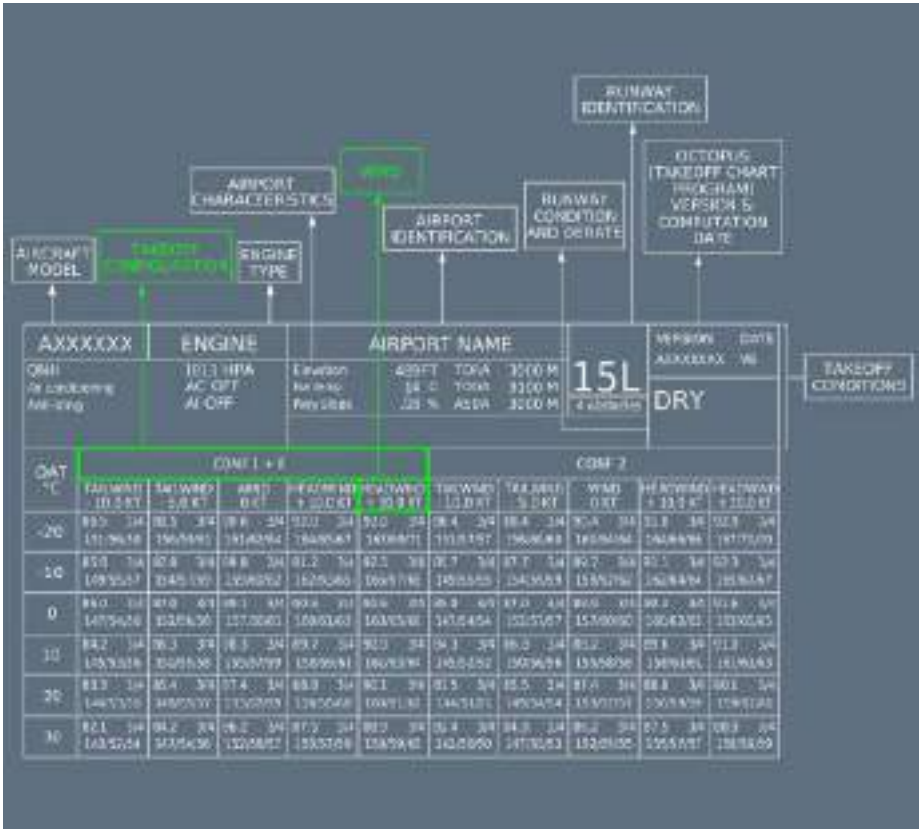
ONE ENGINE OUT CLIMB PROCEDURE

Ident.: PER-TOF-TOC-10-30-00001708.0001001 / 23 FEB 11
Applicable to: ALL

The performance given in the chart is consistent with the flight path specified for the aircraft with one engine out and takes into account significant obstacles.
When the procedure to be followed is not the standard instrument departure, the chart describes a specific procedure (EOSID).
When the specified procedure requires a turn, except if otherwise stated on the RTOW chart, the turn should be performed with a maximum bank of 15 ° until the aircraft reaches 1 500 ft or until green dot.
The acceleration height (or altitude) ensures that the net flight path clears the highest obstacle by at least 35 ft when accelerating in level flight to green dot speed after an engine failure, in the most adverse conditions.

TAKEOFF ON A WET RUNWAY

Ident.: PER-TOF-TOC-10-30-00001709.0002001 / 23 FEB 11
Applicable to: ALL



Takeoff charts computed for wet runway with a 15 ft screen height and/or use of reverse thrust may produce, in some conditions, a maximum takeoff weight (or flexible temperature) higher than that obtained for a dry runway. It is thus mandatory to compare both charts (dry and wet) and retain the lower of the two weights (or flexible temperature) and the associated speeds determined for a wet runway.

Note: The crew need not compare the charts if the top of the wet runway chart specifies "DRY CHECK". (The comparison has already been inserted in the WET runway calculation).

DETERMINATION OF MAXIMUM TAKEOFF WEIGHT AND SPEEDS

DIRECT CHART READING

Ident.: PER-TOF-TOC-12-10-00001712.0002001 / 23 FEB 11
Applicable to: ALL

The takeoff chart is computed for a given runway under a set of conditions, which are:
- OAT
- Wind
- Configuration
- QNH, air conditioning, anti ice...

Two configurations are produced on the chart. This enables the crew to select that giving the highest permissible takeoff weight. In case of equivalent performance, retain the configuration giving the lower takeoff speeds.
For a given configuration, enter the chart with the OAT and wind value to determine the maximum permissible weight. For an OAT or wind value not presented on the chart, interpolate between two consecutive temperature rows and/or two consecutive wind columns. Conservative OAT or wind values can also be considered. No extrapolation is allowed.

CORRECTIONS DUE TO DIFFERENT TAKEOFF CONDITIONS

Ident.: PER-TOF-TOC-12-10-00001713.0002001 / 28 JAN 11
Applicable to: ALL

Retain the maximum takeoff weight, associated configuration and speeds from above.
For conditions different from those of the chart, apply relevant corrections.

CONSERVATIVE CORRECTIONS FOR QNH AND BLEEDS

Ident.: PER-TOF-TOC-12-10-00014706.0001001 / 29 JUL 16
Applicable to: ALL

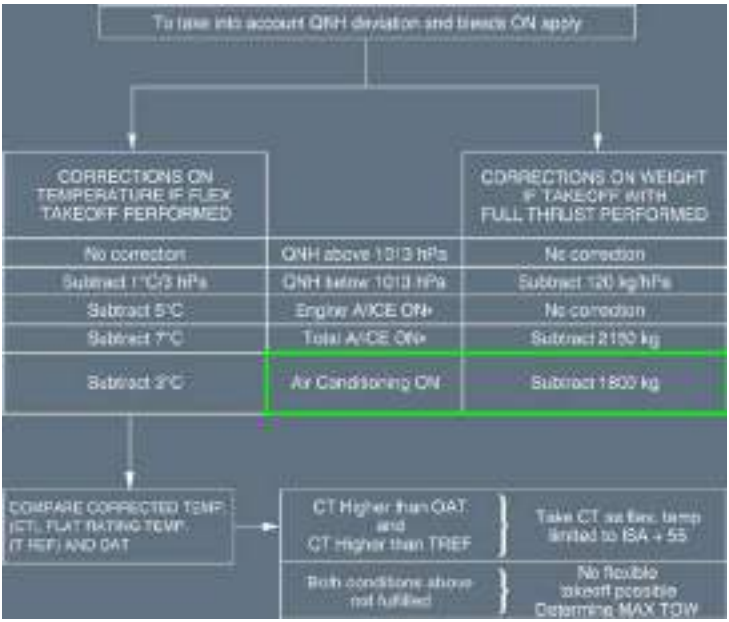
The following data and graphs are for example only, and are not for operational use. Even if the data in the following example is in “kg” and “m”, the same method can be applied for “lb” and “ft”.

Corrections are given for QNH ≠ 1 013 hPa, air conditioning ON, anti ice ON(*Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS*).

1. For the given wind and temperature conditions, read the maximum takeoff weight.
2. Apply the published weight correction(s) to the maximum takeoff weight (for each correction) to determine the maximum permissible takeoff weight.
3. Read the speeds associated with the maximum permissible takeoff weight by entering the chart in the wind column.

EXAMPLE 1

DATA: OAT = 25 °C
Head Wind = 10 kt
Air conditioning ON
QNH = 1 013 hPa



Use the chart (*Refer to PER-TOF-TOC-10-30 EXAMPLE OF TAKEOFF CHART*):

Enter the 10 kt head wind column and interpolate for 25 °C, CONF 1+F,

Maximum TO weight (1 000 kg) air conditioning OFF.....82.1
Enter the 10 kt head wind column and interpolate for 25 °C, CONF 2,
Maximum TO weight (1 000 kg) air conditioning OFF.....82.1
Retain CONF 2 as takeoff configuration as the speeds are lower.
Maximum TO weight (1 000 kg) air conditioning OFF.....82.1

Use the QNH/BLEEDS correction page:(*Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS*).
For example:

Air conditioning correction..... -1.8
Maximum permissible TO weight (1 000 kg) air conditioning ON..... 80.3
Determine takeoff speeds for 80.3 (1 000 kg) in the 10 kt head wind column CONF 2 (interpolate when necessary).

V1 = 152 kt, VR = 153 kt, V2 = 158 kt.

CORRECTIONS FOR WET OR CONTAMINATED RUNWAYS

Ident.: PER-TOF-TOC-12-10-00001715.0001001 / 28 JAN 11
Applicable to: ALL

(*Refer to PER-TOF-CTA-10 GENERAL*)

CORRECTIONS PRODUCED ON THE RTOW CHART

Ident.: PER-TOF-TOC-12-10-00014707.0001001 / 27 JUL 18
Applicable to: ALL

The following data and graphs are for example only, and are not for operational use. Even if the data in the following example is in “kg” and “m”, the same method can be applied for “lb” and “ft”.
For example: *Refer to PER-TOF-TOC-10-30 EXAMPLE OF TAKEOFF CHART*
A description of this correction is given on *Refer to PER-TOF-TOC-10-20 DESCRIPTION OF THE CORRECTIONS ON TAKEOFF CHART*. The list of corrections is not exhaustive, however the most commonly used corrections are wet runway, QNH, air conditioning and/or anti ice. A maximum of three corrections can be produced on one chart.

To apply the corrections, proceed as follows:

1. Enter the chart with given OAT and wind to determine the maximum takeoff weight before correction.
2. Apply the first correction:
   If OAT is less than or equal to TVMC (line 3), apply ΔW correction from line 1 and ΔV1/ΔVR/ΔV2 corrections from line 2.
   Else, (for OAT greater than TVMC), apply ΔW correction from line 3 and ΔV1/ΔVR/ΔV2 corrections from line 4.
3. To combine a second (and third, as applicable) correction:
   If OAT is less than or equal to TVMC (line 3), apply ΔW correction from line 1 and ΔV1/ΔVR/ΔV2 corrections from line 2.
   Check that the resulting speeds are higher than the minimum speeds displayed on the RTOW chart and that V2 is higher than the VMU limited speed (*Refer to PER-TOF-TOD-25-20 MINIMUM V2 LIMITED BY VMU/VMCA (KT IAS)*).
   If OAT is higher than TVMC (line 3) or if the above speed check is not fulfilled, apply ΔW correction from line 3 and ΔV1/ΔVR/ΔV2 corrections from line 4. No speed check is required.

Note:
- *QNH correction is given for ±10 hPa . It is allowed to extrapolate linearly for greater QNH deviation.*
- *When using a takeoff chart with failure cases, it is not allowed to combine two failure cases.*
- *Corrections from the chart must be applied from top to bottom, i.e. in the RTOW on Refer to PER-TOF-TOC-10-30 EXAMPLE OF TAKEOFF CHART, apply the wet correction first.*
- *If asterisk or dotted lines appear in the correction boxes, refer to more conservative corrections provided in the FCOM.*
- *No speed check is required for the first correction. However, if the first influence correction follows a conservative FCOM correction, a speed check is required.*

EXAMPLE 2

DATA : CONF 2
OAT = 25 °C
Head Wind = 10 kt
QNH = 1 028 hPa
WET runway

In this example, we will consider CONF 2 as takeoff configuration. But same computation has to be done in CONF 1 and you must retain the best configuration.
Use the chart (*Refer to PER-TOF-TOC-10-30 EXAMPLE OF TAKEOFF CHART*)

- Enter the 10 kt head wind column and interpolate for 25 °C, CONF 2, max TO weight (1 000 kg).....82.1
- Read associated speeds as V1 = 156 kt, VR = 157 kt, V2 = 162 kt
- Apply WET correction

For OAT < TVMC (54 °C), ΔW =..... -1.2
Intermediate weight (1 000 kg).....= 80.9
Associated speeds,
V1 = 156 kt - 10 = 146 kt
VR = 157 kt - 1 = 156 kt
V2 = 162 kt - 1 = 161 kt
(No speed check required for first correction)

- Apply QNH correction

For OAT < TVMC (54 °C), ΔW = 0.2 × 15/10 =.....+ 0.3
Maximum permissible takeoff weight (1 000 kg).....= 81.2
Associated speeds,
V1 = 146 kt + 1 × 15/10 = 147 kt
VR = 156 kt + 1 × 15/10 = 158 kt
V2 = 161 kt + 1 × 15/10 = 163 kt

- Check that the speeds are higher than minimum speeds from the chart and from VMU table (*Refer to PER-TOF-TOD-25-20 MINIMUM V2 LIMITED BY VMU/VMCA (KT IAS)*).
  It is reminded that if the speed checks are not fulfilled, the corrections must be recalculated using those provided on lines 3 and 4.

	Takeoff Configuration : 2			
	TOW	**V1**	**VR**	**V2**
TOW (RTOW)	82.1	156	157	162
FCOM correction(s)				
Intermediate value	82.1	156	157	162
WET Correction	- 1.2	-10	-1	-1
Intermediate value	80.9	146	156	161
QNH Correction	+ 0.3	+1	+2	+2
Final value	81.2	147	158	163

COMBINING CORRECTIONS FROM FCOM AND CHART

Ident.: PER-TOF-TOC-12-10-00014713.0001001 / 29 JUL 16
Applicable to: ALL

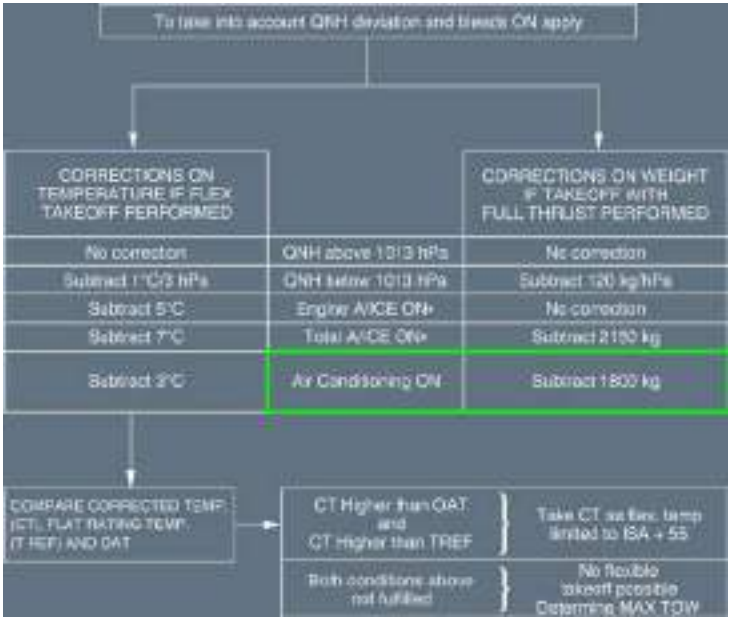
The following data and graphs are for example only, and are not for operational use. Even if the data in the following example is in “kg” and “m”, the same method can be applied for “lb” and “ft”.

Proceed as follows:

1. Enter the chart with selected configuration, OAT and wind to read the maximum takeoff weight.
2. Apply corrections from FCOM to determine an intermediate weight. Interpolate associated speeds for intermediate weight in the same column (same wind and configuration).
3. Apply corrections from RTOW chart as explained above.

EXAMPLE 3

DATA :
CONF 2
OAT = 25 °C
Head wind = 10 kt
Air conditioning ON
QNH = 1 028 hPa
WET runway



In this example, we will consider CONF 2 as takeoff configuration. But same computation has to be done in CONF 1 and you must retain the best configuration.

1. Use the chart (*Refer to PER-TOF-TOC-10-30 EXAMPLE OF TAKEOFF CHART*).

Enter the 10 kt head wind column and interpolate for 25 °C, CONF 2,
Max TO weight (1 000 kg) air conditioning OFF..... 82.1

2. First, apply the QNH/Bleeds correction (*Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS*).

Max TO weight (1 000 kg) air conditioning OFF..... 82.1
Air conditioning correction..... - 1.8
Intermediate weight..... = 80.3
Determine the takeoff speeds for 80.3 (1 000 kg) in the 10 kt head wind column CONF 2 (interpolate when necessary)

V1 = 152 kt , VR = 153 kt , V2 = 158 kt

3. Apply WET correction

For OAT < TVMC (54 °C), ΔW =.....-1.2
Intermediate weight..... = 79.1
Associated speeds,
V1 = 152 kt - 10 = 142 kt
VR = 153 kt - 1 = 152 kt
V2 = 158 kt - 1 = 157 kt
(No speed check required for first correction).
Apply QNH correction

For OAT < TVMC (54 °C), ΔW = 0.2 × 15/10 =.....+0.3
Max permissible takeoff weight..... = 79.4
Associated speed,
V1 = 142 kt + 1 × 15/10 = 143 kt
VR = 152 kt + 1 × 15/10 = 154 kt
V2 = 157 kt + 1 × 15/10 = 159 kt

Check that the speeds are higher than minimum speeds from the chart and from VMU table (*Refer to PER-TOF-TOD-25-20 MINIMUM V2 LIMITED BY VMU/VMCA (KT IAS)*)(it is reminded that if the speed checks are not fulfilled, the corrections must be recalculated using those provided on lines 3 and 4).
Since the speed check is fulfilled:
Max permissible takeoff weight = 79.4 (1 000 kg)
V1 = 143 kt, VR = 154 kt, V2 = 159 kt.

	Takeoff Configuration : 2			
	TOW	**V1**	**VR**	**V2**
TOW (RTOW)	82.1			
FCOM correction(s)	- 1.8			
Intermediate value	80.3	152	153	158
WET Correction	- 1.2	-10	-1	-1
Intermediate value	79.1	142	152	157
QNH Correction	+ 0.3	+1	+2	+2

Continued on the following page

Continued from the previous page

EXTRAPOLATION

EXTRAPOLATION

Ident.: PER-TOF-TOC-12-30-00001716.0001001 / 01 MAR 11

1 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

For a takeoff weight lower than those displayed on the chart, associated speeds are calculated as follows :

1. For a given wind, note the speeds associated with the takeoff weight in the row displaying the highest permissible temperature.
2. Apply a speed correction of 1 kt per 1 000 kg (0.5 kt per 1 000 lb) weight decrement to V1, VR and V2 limited to minimum speeds.

EXTRAPOLATION

Ident.: PER-TOF-TOC-12-30-00001716.0002001 / 01 MAR 11

2 **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

For a takeoff weight lower than those displayed on the chart, associated speeds are calculated as follows :

1. For given configuration and wind, note the speeds associated with the takeoff weight in the row displaying the highest permissible temperature.
2. Apply speed corrections provided at the bottom of the RTOW chart to V1, VR and V2 limited to the minimum speeds.

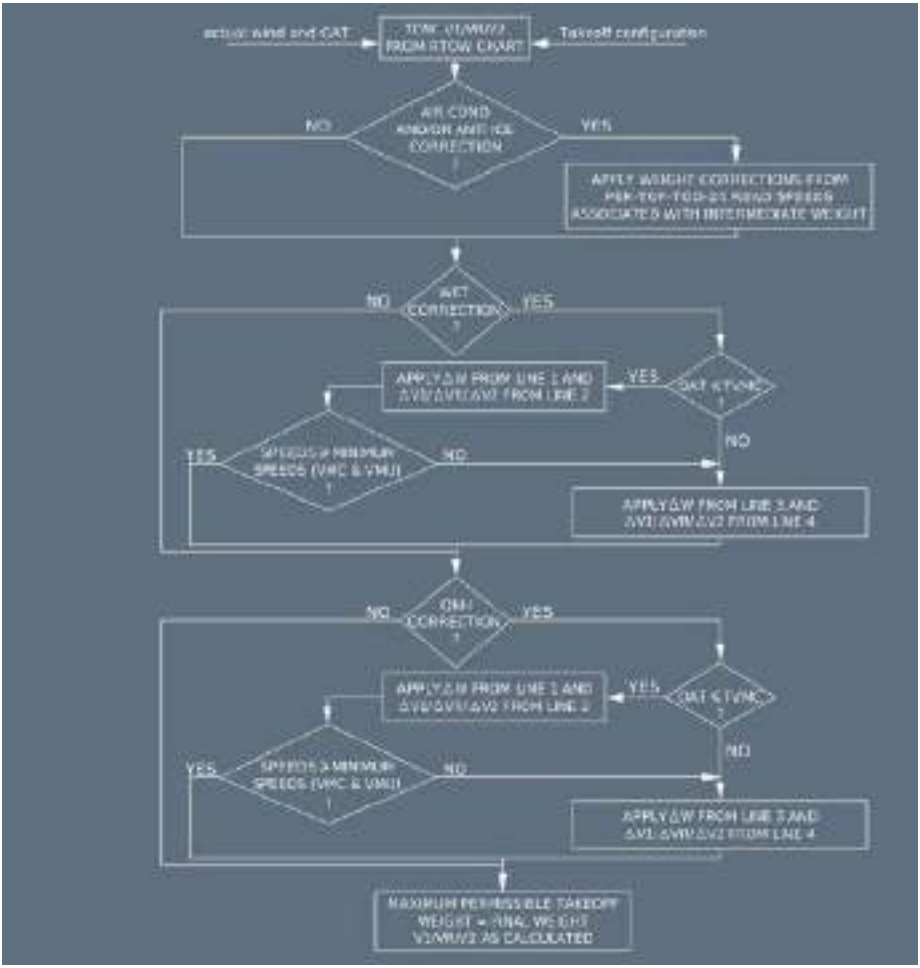
Intentionally left blank

MAXIMUM STRUCTURAL TAKEOFF WEIGHT

MAXIMUM STRUCTURAL TAKEOFF WEIGHT

Ident.: PER-TOF-TOC-12-40-00001717.0001001 / 18 MAR 11
Applicable to: ALL

The maximum structural takeoff weight is a weight limitation depending on the aircraft. This limitation is provided in the Flight Manual and in *Refer to LIM-AG-WGHT Weight Limitations*. Compare the maximum structural takeoff weight to the maximum permissible takeoff weight computed for given conditions and retain the lower of the two values.



Intentionally left blank

SUMMARY

SUMMARY

Ident.: PER-TOF-TOC-12-50-00006313.0001001 / 11 MAR 11
Applicable to: ALL

The following flow diagram gives the different steps to follow.

Intentionally left blank

DETERMINATION OF FLEXIBLE TAKEOFF TEMPERATURE AND SPEEDS

GENERAL

Ident.: PER-TOF-TOC-14-10-00001722.0002001 / 17 MAR 11
Applicable to: ALL

Before determining the flexible temperature, calculate the maximum permissible takeoff weight (see previous section) and ensure that the actual takeoff weight is lower than the determined maximum takeoff weight.

- Enter the RTOW chart with the wind condition to interpolate for the actual takeoff weight. Read the flexible temperature in the temperature column corresponding to the actual weight.
- Repeat this process for the other configuration available. Select the configuration giving the highest flexible temperature.

CORRECTIONS DUE TO DIFFERENT TAKEOFF CONDITIONS

Ident.: PER-TOF-TOC-14-10-00001723.0001001 / 03 MAR 14
1 **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

When the takeoff conditions are different from those provided on the chart, apply the associated corrections.

Note: - *If the RTOW chart is based on the CG being at 25 %, the crew can determine the flexible temperature at a more forward CG by decreasing the flexible temperature by 2 °C. V1, VR and V2 must be increased by 1 kt.*
- *25 % CG is the basic certified limit, on which all takeoff computations are based. To take into account the operational margins, the above penalties must be applied when operational CG is forward 27 % CG.*

CORRECTIONS DUE TO DIFFERENT TAKEOFF CONDITIONS

Ident.: PER-TOF-TOC-14-10-00001723.0002001 / 14 MAR 11
2 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

When the takeoff conditions are different from those provided on the chart, apply the associated corrections.

CONSERVATIVE CORRECTIONS FOR QNH AND BLEEDS

Ident.: PER-TOF-TOC-14-10-00014714.0001001 / 29 JUL 16
Applicable to: ALL

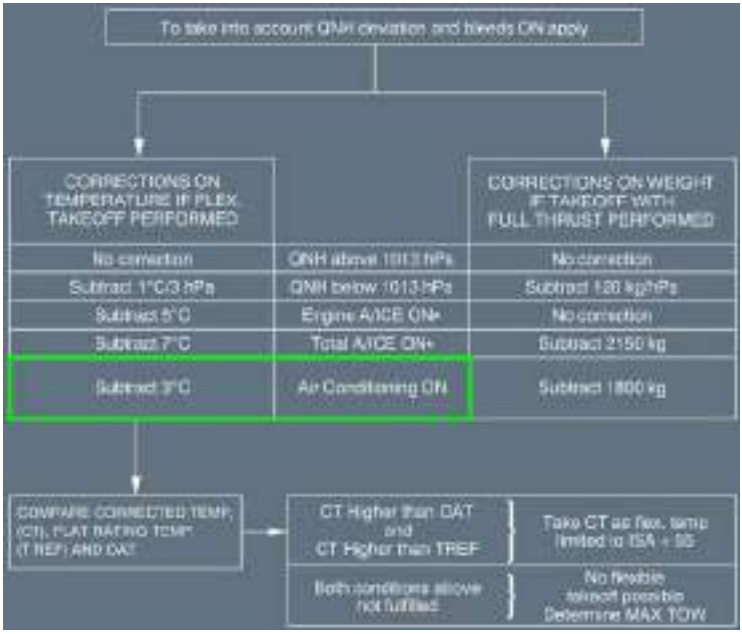
CONSERVATIVE CORRECTIONS FOR QNH AND BLEEDS

The following data and graphs are for example only, and are not for operational use. Even if the data in the following example is in “kg” and “m”, the same method can be applied for “lb” and “ft”.

Corrections are given for QNH ≠ 1 013 hPa , air conditioning ON, anti ice ON (*Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS*).

1. For a given takeoff weight, wind condition and selected configuration, determine the flexible temperature. Retain the takeoff speeds associated with the actual weight.
2. Apply the published temperature correction. To combine two or more corrections, add the different corrections and apply to temperature value.
   (No speed corrections required).

EXAMPLE 2



DATA : Actual takeoff weight = 75 600 kg
Head wind = 10 kt
Air conditioning ON
QNH = 1 013 hPa

Use the chart: (*Refer to PER-TOF-TOC-10-30 EXAMPLE OF TAKEOFF CHART*).

Determine the maximum permissible takeoff weight. The actual weight being lower than the maximum one, flexible takeoff is possible.
Enter the 10 kt head wind column and interpolate for 75 600 kg, CONF 1+F,
Flexible temperature..... 53 °C
Enter the 10 kt head wind column and interpolate for 75 600 kg, CONF 2,
Flexible temperature..... 53 °C

Retain CONF 2 as the speeds are lower.
Takeoff speeds are V1 = 149 kt, VR = 150 kt, V2 = 155 kt
Flexible temperature with air conditioning OFF.....53 °C
Use the QNH/Bleeds corrections:(*Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS*).
For example:

Air conditioning correction .....-3 °C
Flexible temperature.....= 50 °C
Check that OAT/TREF < flex temperature ≤ TMAXFLEX
TMAXFLEX is specified in LIM-70.

CORRECTIONS FOR WET RUNWAY

Ident.: PER-TOF-TOC-14-10-00001725.0001001 / 28 JAN 11
Applicable to: ALL

CORRECTIONS FOR WET RUNWAY

(*Refer to PER-TOF-CTA-10 GENERAL*)

CORRECTIONS PRODUCED ON THE RTOW CHART

Ident.: PER-TOF-TOC-14-10-00014717.0001001 / 29 JUL 16
Applicable to: ALL

The following data and graphs are for example only, and are not for operational use. Even if the data in the following example is in “kg” and “m”, the same method can be applied for “lb” and “ft”.
For a description of this correction *Refer to PER-TOF-TOC-10-20 DESCRIPTION OF THE CORRECTIONS ON TAKEOFF CHART*. The list of corrections is not exhaustive, however the most commonly used corrections are wet runway, QNH, air conditioning and/or anti-icing. A maximum of three corrections can be produced on one chart.

To apply the correction, proceed as follows:

1. Enter the chart with wind and selected configuration. Interpolate for actual takeoff weight. Read flexible temperature associated with this weight.
2. Apply the first correction:
   Apply ΔTflex correction and apply speed corrections (ΔV1/ ΔVR/ ΔV2).
   Check that the resulting V2 is higher than the VMU Limited speed (*Refer to PER-TOF-TOD-25-20 MINIMUM V2 LIMITED BY VMU/VMCA (KT IAS)*). If the speed checks are not fulfilled, flexible takeoff is not possible. Set TOGA thrust and retain the speeds associated with maximum permissible takeoff weight or the speeds read in the chart of the actual weight if they are all lower.
   No speed correction is required for QNH and bleeds influence (Not applicable to maximum takeoff weight determination).
3. To combine a second and/or a third correction, proceed as per point 2, except that also the resulting speeds must be checked higher than the minimum speed displayed on the RTOW chart.
4. Check that the final flexible temperature is:
   - higher than OAT and TREF
   - limited to TMAXFLEX
     If the check is fulfilled, retain final flexible temperature as the one to be inserted in the MCDU.
     If the check is not fulfilled, (final flexible temperature lower than OAT or TREF), no flexible takeoff is possible.
     Use TOGA thrust and retain speeds that have been calculated for the maximum permissible takeoff weight. (*Refer to PER-TOF-TOC-14-20 FLEXIBLE TAKEOFF NOT POSSIBLE*)

Note: - *QNH correction is given for ±10 hPa. It is allowed to extrapolate linearly for greater QNH deviation.*
- *Corrections from the chart must be applied from top to bottom, i.e. in the RTOW on Refer to PER-TOF-TOC-10-30 EXAMPLE OF TAKEOFF CHART, apply the wet influence first.*

Note: - *If asterisk or dotted lines appear in the influence boxes, refer to more conservative corrections provided in the FCOM.*

EXAMPLE 5

DATA : CONF 2
Actual takeoff weight = 75 600 kg
Head wind = 10 kt
WET runway
Air conditioning OFF
QNH = 1 023 hPa

In this example, we will consider CONF 2 as takeoff configuration. But same computation has to be done in CONF 1 and you must retain the best configuration.
Use the chart:(*Refer to PER-TOF-TOC-10-30 EXAMPLE OF TAKEOFF CHART*).

Determine the maximum permissible takeoff weight (see example 2). The actual weight being lower than the maximum one, flexible takeoff is possible.
Enter the 10 kt head wind column and interpolate for 75 600 kg, CONF 2,
Flexible temperature.....53 °C
Takeoff speeds are V1 = 149 kt, VR = 150 kt, V2 = 155 kt
Apply WET correction

ΔTflex =..... -2 °C
Intermediate flex temperature..... = 51 °C
Associated speeds,
V1 = 149 kt – 10 = 139 kt
VR = 150 kt – 1 = 149 kt
V2 = 155 kt – 1 = 154 kt
Check that V2 is higher than the VMU. (*Refer to PER-TOF-TOD-25-20 MINIMUM V2 LIMITED BY VMU/VMCA (KT IAS)*).
Apply QNH correction

ΔTflex =.....0 °C
Maximum flexible temperature.....= 51 °C
No speed correction is required for QNH and bleed influence.
Takeoff speeds are V1 = 139 kt, VR = 149 kt, V2 = 154 kt
Check that OAT/TREF < flex temperature ≤ TMAXFLEX
TMAXFLEX is specified in LIM-70.

	Takeoff Configuration: 1 + F			
	Tflex	**V1**	**VR**	**V2**
Chart temperature	53	149	150	155
FCOM correction(s)

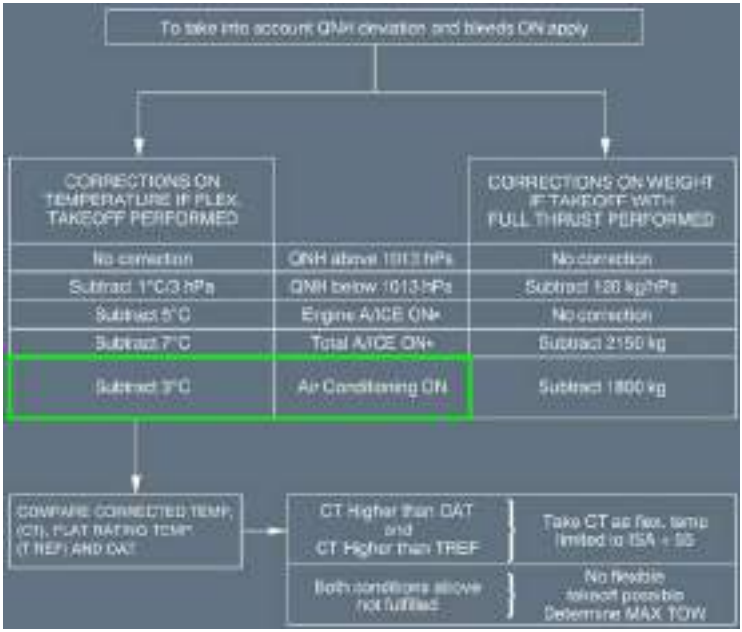
WET Correction	-2	-10	-1	-1
Intermediate value	51	139	149	154
QNH Correction	0	0	0	0
Final value	51	139	149	154

COMBINING CORRECTIONS FROM FCOM AND CHART

Ident.: PER-TOF-TOC-14-10-00014718.0001001 / 29 JUL 16
Applicable to: ALL

The following data and graphs are for example only, and are not for operational use. Even if the data in the following example is in “kg” and “m”, the same method can be applied for “lb” and “ft”.

1. Apply corrections from FCOM (*Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS*).
2. Apply corrections from the RTOW chart.
   Apply speed corrections except for QNH and bleed influences.



EXAMPLE 6

DATA: CONF 2
Actual takeoff weight = 75 600 kg
Head wind = 10 kt
Air conditioning ON
QNH = 1 028 hPa
WET runway

In this example, we will consider CONF 2 as takeoff configuration. But same computation has to be done in CONF 1 and you must retain the best configuration.
Use the chart (*Refer to PER-TOF-TOC-10-20 DESCRIPTION OF THE CORRECTIONS ON TAKEOFF CHART*). Determine the maximum permissible takeoff weight (*Refer to PER-TOF-TOC-12-10 COMBINING CORRECTIONS FROM FCOM AND CHART*: example 3).
The actual weight being lower than the maximum one, flexible takeoff is possible.

Enter the 10 kt head wind column and interpolate for 75 600 kg, CONF 2,
Flexible temperature.....53 °C
Takeoff speeds are V1 = 149 kt, VR = 150 kt, V2 = 155 kt
First, apply the correction (*Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS*).
Flexible temperature with air conditioning OFF.....53 °C

Air conditioning correction.....-3 °C
Intermediate flexible temperature.....= 50 °C
No speed correction.
Apply WET correction

For flexible temperature < TVMC (54 °C), ΔTflex = ...-2 °C
Intermediate flex temperature..... = 48 °C
Associated speeds,
V1 = 149 kt - 10 = 139 kt
VR = 150 kt - 1 = 149 kt
V2 = 155 kt - 1 = 154 kt
Check that V2 is higher than the VMU (*Refer to PER-TOF-TOD-25-20 MINIMUM V2 LIMITED BY VMU/VMCA (KT IAS)*).
Apply QNH correction

For flexible temperature < TVMC (54 °C), ΔTflex =.....0 °C
Flexible temperature.....= 48 °C
No speed correction is required for QNH and bleed influence.
Takeoff speeds are,
V1 = 139 kt
VR = 149 kt
V2 = 154 kt
Check that OAT/TREF < flex temperature ≤ TMAXFLEX.
TMAXFLEX is specified in LIM-70.

	Takeoff Configuration : 2			
	Tflex	**V1**	**VR**	**V2**
Chart temperature	53	149	150	155
FCOM correction(s)	-3	0	0	0

FLEXIBLE TAKEOFF NOT POSSIBLE

FLEXIBLE TAKEOFF NOT POSSIBLE

Ident.: PER-TOF-TOC-14-20-00001726.0001001 / 30 SEP 13
Applicable to: ALL

In some cases when the actual takeoff weight is lower than the maximum permissible takeoff weight, but the flexible temperature is lower than TREF or OAT, flexible takeoff is not possible. It is mandatory to use TOGA thrust.

For speed determination:

- You can retain the speeds that have been calculated for the maximum permissible takeoff weight; OR
- You can retain the speeds associated with the actual takeoff weight provided they are all lower than the speeds calculated for the maximum permissible takeoff weight.

Intentionally left blank

FLEXIBLE TAKEOFF POSSIBLE BUT NOT USED

FLEXIBLE TAKEOFF POSSIBLE BUT NOT USED

Ident.: PER-TOF-TOC-14-25-00015228.0001001 / 30 SEP 13
Applicable to: ALL

If the flexible takeoff is possible, but the flight crew elects to perform the takeoff with TOGA thrust, for speed determination:

- You can retain the speeds that have been calculated for the maximum permissible takeoff weight; OR
- You can retain the speeds associated with the actual takeoff weight provided they are all lower than the speeds calculated for the maximum permissible takeoff weight.

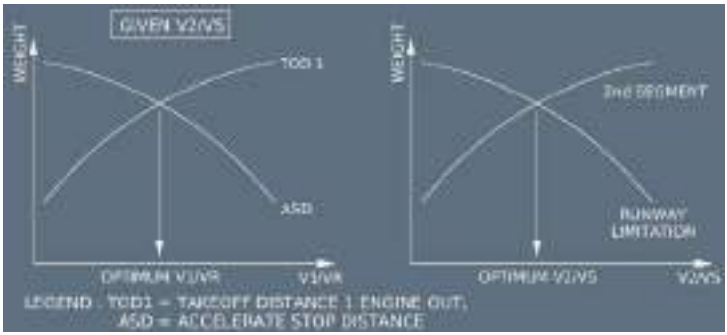
TAKEOFF PERFORMANCE



TAKEOFF PERFORMANCE

Ident.: PER-TOF-TOC-16-10-00001727.0001001 / 23 JUN 15
Applicable to: ALL

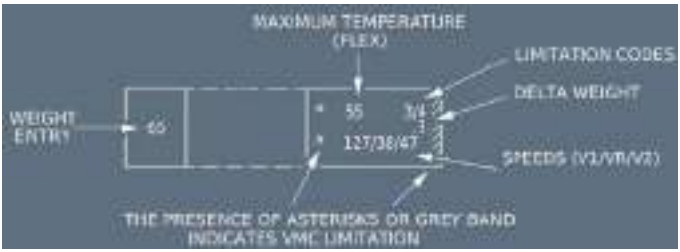
Takeoff optimization is calculated for a given runway and its obstacles and for given conditions of flap setting, temperature, wind and QNH. The calculation produces a maximum permissible takeoff weight (or a maximum takeoff temperature for an actual weight).
The takeoff thrust produced by the engine varies as follows :

The optimization process calculates the speeds which will produce the maximum takeoff weight. To do so, it takes into account the different takeoff limitations such as TOD, ASD, TOR, second segment..., as shown on the charts below.

On a typical runway, the performance of a twin engine aircraft, is generally limited by the one engine out operation at takeoff. The optimum V2/VS and optimum V1/VR are consequently unique.

Intentionally left blank

TAKEOFF CHART DESCRIPTION



GENERAL

Ident.: PER-TOF-TOC-16-20-00001728.0003001 / 28 FEB 11
Applicable to: ALL

The takeoff chart (RTOW : Regulatory Takeoff Weight) is calculated for a specific aircraft version and for a particular runway specified at the top of the chart. The top of the chart also gives some information about the runway and lists the calculation assumptions.

The chart is given for 2 different configurations and 4 wind values per configuration. This allows the crew to select the configuration that gives either :
- the highest permissible takeoff weight, or, for a given weight,
- the highest flexible temperature.

If different configurations give equivalent performance, the crew should select the configuration associated with the lowest takeoff speeds.
The left column of the chart contains weight entry. For each weight entry (and for a given configuration and wind), the chart provides the following information :

Note: *The takeoff weight is the sum of the weight entry and the delta weight.*

The available limitation codes are :

- First segment	:	1
- Second segment	:	2
- Runway length	:	3
- Obstacles	:	4
- Tire speed	:	5
- Brake energy	:	6
- Maximum computation weight	:	7
- Final takeoff	:	8
- VMU	:	9

CORRECTIONS DUE TO DIFFERENT TAKEOFF CONDITIONS

Ident.: PER-TOF-TOC-16-20-00001729.0002001 / 16 MAR 11

[1] **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

Each takeoff chart is computed for a given set of conditions (air conditioning, QNH, anti ice...) specified at the top of the chart. If the actual takeoff conditions are different, the crew must apply corrections.

Two types of corrections are available :

- Conservative corrections (*Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS*) (to be used when not provided on the chart).
- Corrections (less restrictive) listed on the chart, to be applied as explained below.

CORRECTIONS DUE TO DIFFERENT TAKEOFF CONDITIONS

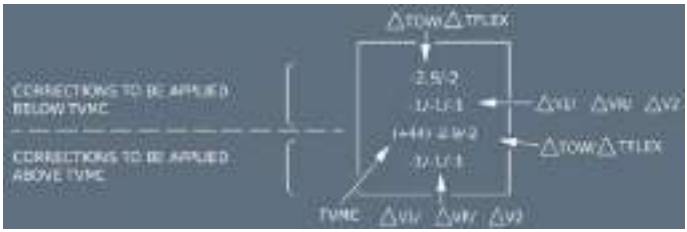
Ident.: PER-TOF-TOC-16-20-00001729.0105001 / 19 DEC 14

[2] **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

Each takeoff chart is computed for a given set of conditions (air conditioning, QNH, anti ice...) specified at the top of the chart. If the actual takeoff conditions are different, the crew must apply corrections.

Two types of corrections are available :

- Conservative corrections (*Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS*) (to be used when not provided on the chart).
- Corrections (less restrictive) listed on the chart, to be applied as explained below.



Note: *1. If the RTOW chart is based on the CG being at 25 %, the crew can find the takeoff performance at a more forward CG by decreasing the takeoff weight by 1 000 kg (2 200 lb) and increasing V1, VR and V2 by 1 kt.*

2. 25 % CG is the basic certified limit, on which all takeoff computations are based. To take into account the operational margins, the above penalties must be applied when operational CG is forward 27 % CG.

DESCRIPTION OF THE CORRECTIONS ON TAKEOFF CHART

Ident.: PER-TOF-TOC-16-20-00006633.0001001 / 08 JUL 15
Applicable to: ALL

The corrections are presented on 4 lines :

TVMC is a temperature value given per column. This is a fictitious value that indicates the temperature above which the speeds are close to a VMCG/VMCA limitation or are VMCG/VMCA limited.

Note: The lower two lines may be shaded on certain chart formats.

MINIMUM SPEED

Ident.: PER-TOF-TOC-16-20-00006634.0001001 / 08 JUL 15
Applicable to: ALL

Minimum V1/VR/V2 due to VMCG/VMCA are provided on the bottom right side of the takeoff chart. They are only applicable in case of speed corrections.
These speeds are conservative. They may be slightly higher than V1/VR/V2 displayed on the takeoff chart.

Intentionally left blank

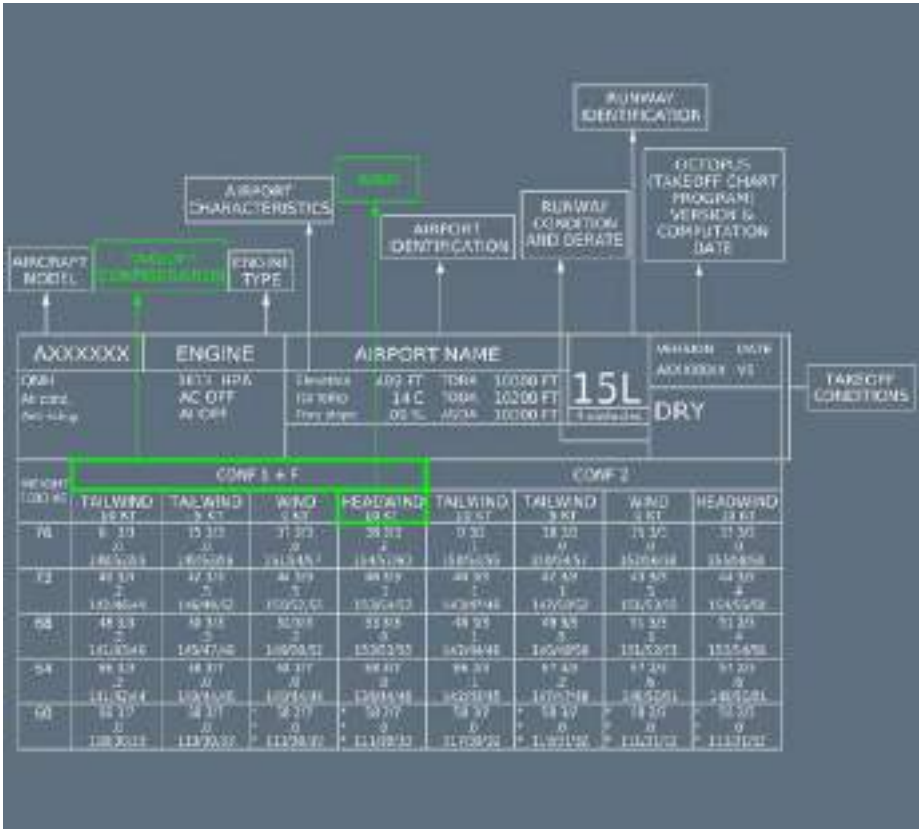
ADDITIONAL INFORMATION

ONE ENGINE OUT CLIMB PROCEDURE

Ident.: PER-TOF-TOC-16-30-00001730.0001001 / 10 DEC 09
Applicable to: ALL

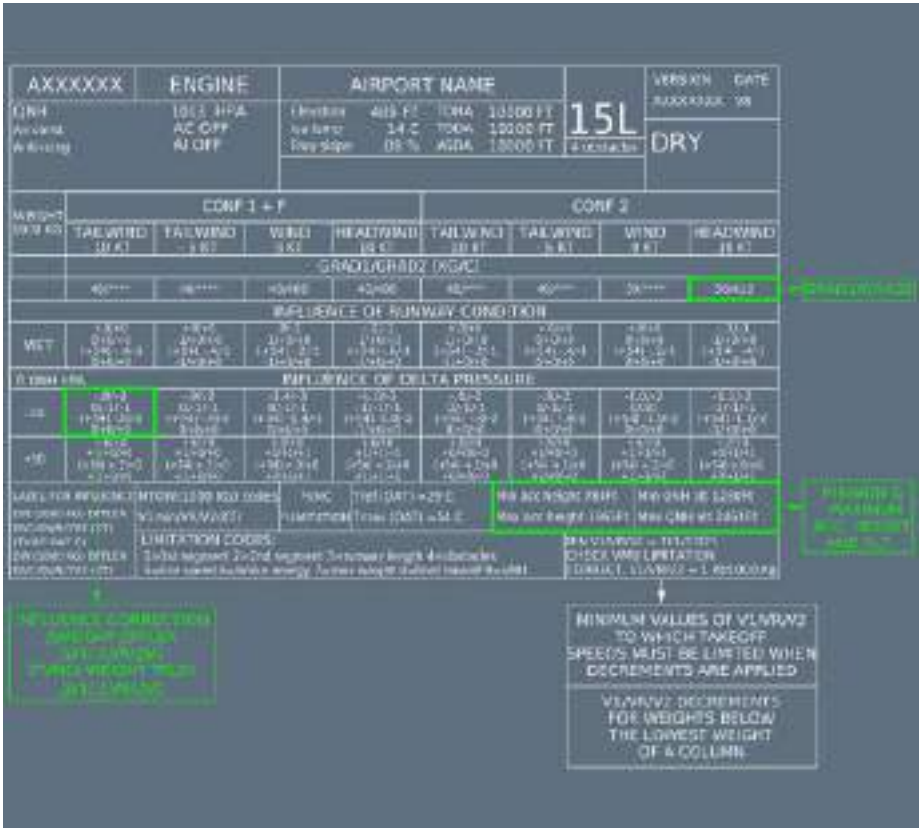
The performance given in the chart is consistent with the flight path specified for the aircraft with one engine out and takes into account significant obstacles.
When the procedure to be followed is not the standard instrument departure, the chart describes a specific procedure (EOSID).
When the specified procedure requires a turn, except if otherwise stated on the RTOW chart, the turn should be performed with a maximum bank of 15 ° until the aircraft reaches 1 500 ft or until green dot.
The acceleration height (or altitude) ensures that the net flight path clears the highest obstacle by at least 35 ft when accelerating in level flight to green dot speed after an engine failure, in the most adverse conditions.

TAKEOFF ON A WET RUNWAY



Ident.: PER-TOF-TOC-16-30-00001731.0002001 / 10 DEC 09
Applicable to: ALL

Takeoff charts computed for wet runway with a 15 ft screen height and/or use of reverse thrust may produce, in some conditions, a maximum takeoff weight (or flexible temperature) higher than that obtained for a dry runway. It is thus mandatory to compare both charts (dry and wet) and retain the lower of the two weights (or flexible temperature) and the associated speeds determined for a wet runway.



Note: The crew need not compare the charts if the top of the wet runway chart specifies "DRY CHECK". (The comparison has already been inserted in the WET runway calculation).

DETERMINATION OF MAXIMUM TAKEOFF WEIGHT AND SPEEDS

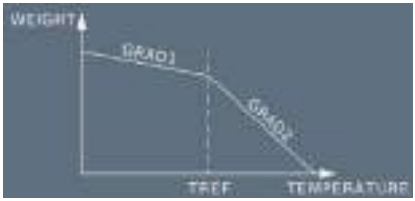
GENERAL

Ident.: PER-TOF-TOC-18-10-00001734.0002001 / 10 DEC 09
Applicable to: ALL

The takeoff chart is computed for a given runway under a set of conditions, which are :

- OAT
- Wind
- Configuration
- QNH, air conditioning, anti ice...

Two configurations are produced on the chart. This enables the crew to select that giving the highest permissible takeoff weight.
In case of equivalent performance, retain the configuration giving the lower takeoff speeds.



MTOW DETERMINATION

Ident.: PER-TOF-TOC-18-10-00013648.0002001 / 01 MAR 11
Applicable to: ALL

Enter the chart with the given configuration and actual wind column reading the temperature value. This temperature value stands for the OAT. Read the maximum takeoff weight corresponding to the actual OAT. Note that it is allowed to interpolate between two consecutive lines to obtain the maximum takeoff weight.
It is reminded that the takeoff weight is the sum of the weight entry and the delta weight. Similarly determine the takeoff speeds associated with the maximum takeoff weight.
In some cases, it may happen that the first temperature value (displayed for the highest weight entry) is higher than OAT. In this case, it is allowed to extrapolate the weight value to avoid unnecessary penalty. Use the Grad 1/Grad 2 gradients provided at the bottom of the corresponding column.

CORRECTION TO WEIGHT

Grad 1/Grad 2 are gradients provided for both sides of the flat rating temperature (TREF).
Grad 1 applies to temperatures below TREF and Grad 2 applies above TREF.
Read the lowest temperature of the column (corresponding to the highest weight entry).

- **If the lowest temperature and OAT are above TREF.**
  Obtain weight increment by multiplying Grad 2 by the difference in temperature between OAT and lowest temperature. Add this weight increment to the maximum takeoff weight calculated for the lowest temperature.
- **If the lowest temperature and OAT are below TREF.**
  Obtain weight increment by multiplying Grad 1 by the difference in temperature between OAT and lowest temperature. Add this weight increment to the maximum takeoff weight calculated for the lowest temperature.
- **If OAT is below TREF and lowest temperature is above TREF.**
  The weight increment is calculated in two steps. Step one is multiplying Grad 2 by temperature difference between lowest temperature and TREF. Step two is multiplying Grad 1 by temperature difference between TREF and OAT. Add results from step one and two to maximum takeoff weight calculated for lowest temperature.

Note: *Use the weight gradients only to extrapolate above the maximum weight shown in the RTOW chart. They are not valid for interpolation between two boxes, between filled boxes or between one filled and one blank box.*

Repeat the above process for the other available configuration and retain the configuration giving the highest takeoff weight.

CORRECTIONS DUE TO DIFFERENT TAKEOFF CONDITIONS

Ident.: PER-TOF-TOC-18-10-00001736.0002001 / 11 FEB 11
Applicable to: ALL

Retain the maximum takeoff weight, associated configuration and speeds from above.
For conditions different from those of the chart, apply relevant corrections.

CONSERVATIVE CORRECTIONS FOR QNH AND BLEEDS

Ident.: PER-TOF-TOC-18-10-00014720.0001001 / 29 JUL 16
Applicable to: ALL

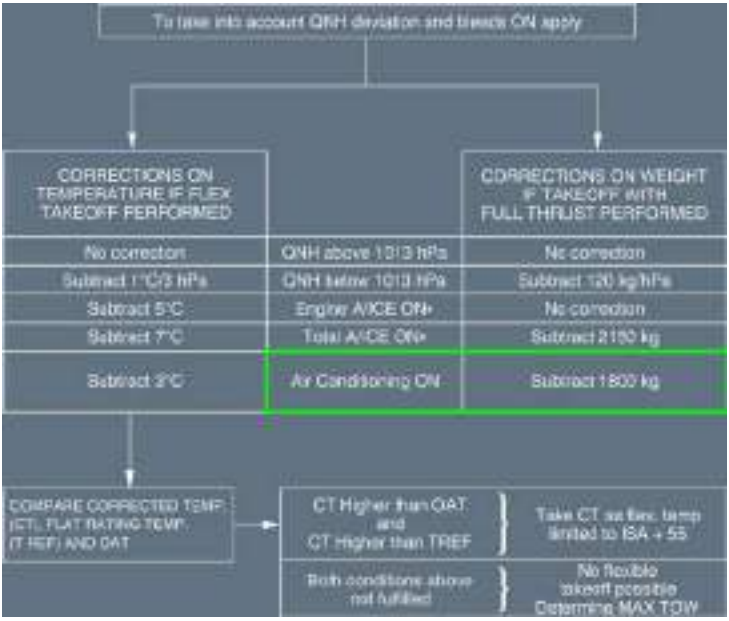
The following data and graphs are for example only, and are not for operational use. Even if the data in the following example is in “kg” and “m”, the same method can be applied for “lb” and “ft”.

Corrections are given for QNH ≠ 1 013 hPa, air conditioning ON, anti ice ON.

1. For the given wind and temperature conditions, determine the maximum takeoff weight.
2. Apply the published weight correction(s) to the maximum takeoff weight (for each correction) to determine the maximum permissible takeoff weight.
3. Read the speeds associated with the maximum permissible takeoff weight by entering the chart in the wind column with the retained weight value.

EXAMPLE A

DATA : OAT = 25 °C
Head Wind = 10 kt
Air conditioning ON
QNH = 1 013 hPa



Use the chart from (*Refer to PER-TOF-TOC-16-30 RTOW EXAMPLE*).

Enter the 10 kt head wind column CONF 1 + F, to read for 25 °C
The lowest temperature of the column is 45 °C, use Grad 1/Grad 2 to extrapolate the maximum takeoff weight.

TRef value is available on the bottom of this table.
Here, TRef is equal to 44 °C.
MAX TO weight (1 000 kg) air conditioning OFF = 80.6 + 0.46 × 1 + 0.06 × 19 = 82.2
Enter the 10 kt head wind column CONF 2, to read for 25 °C
The lowest temperature of the column is 46 °C, use Grad 1/Grad 2 to extrapolate the maximum takeoff weight.
MAX TO weight (1 000 kg) air conditioning OFF = 80.3 + 0.47 × 2 + 0.05 × 19 = 82.1
Retain CONF 1 + F as takeoff configuration.
Maximum TO weight (1 000 kg) air conditioning OFF..... 82.2
Use the QNH/BLEEDS correction page (*Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS*):

Air conditioning correction..... -1.8
Maximum permissible TO weight (1 000 kg) air conditioning ON..... = 80.4
Determine takeoff speeds for 80.4 (1 000 kg) in the 10 kt head wind column CONF 1 + F (interpolate when necessary).

V1 = 155 kt, VR = 156 kt, V2 = 158 kt

CORRECTIONS FOR WET OR CONTAMINATED RUNWAYS

Ident.: PER-TOF-TOC-18-10-00004071.0001001 / 10 DEC 09
Applicable to: ALL

(*Refer to PER-TOF-CTA-10 GENERAL*)

CORRECTIONS PRODUCED ON THE RTOW CHART

Ident.: PER-TOF-TOC-18-10-00014721.0001001 / 29 JUL 16
Applicable to: ALL

The following data and graphs are for example only, and are not for operational use. Even if the data in the following example is in "kg" and "m", the same method can be applied for "lb" and "ft". (*Refer to PER-TOF-TOC-16-30 RTOW EXAMPLE*).
A description of this correction is given in PER-TOF-TOC-16-20 (*Refer to PER-TOF-TOC-16-20 DESCRIPTION OF THE CORRECTIONS ON TAKEOFF CHART*). The list of corrections is not exhaustive, however the most commonly used corrections are wet runway, QNH, air conditioning and/or anti ice. A maximum of three corrections can be produced on one chart.

To apply the corrections, proceed as follows:
1. Determine the maximum takeoff weight before correction for the given OAT and wind condition.
2. Apply the first correction:
   If OAT is less than or equal to TVMC (line 3), apply ΔW correction from line 1 and ΔV1/ΔVR/ΔV2 corrections from line 2.
   Else, (for OAT greater than TVMC), apply ΔW correction from line 3 and ΔV1/ΔVR/ΔV2 corrections from line 4.
3. To combine a second (and third, as applicable) correction:
   If OAT is less than or equal to TVMC (line 3), apply ΔW correction from line 1 and ΔV1/ΔVR/ΔV2 corrections from line 2.
   Check that the resulting speeds are higher than the minimum speeds displayed on the RTOW chart and that V2 is higher than the VMU limited speed (*Refer to PER-TOF-TOD-25-20 MINIMUM V2 LIMITED BY VMU/VMCA (KT IAS)*).
   If OAT is higher than TVMC (line 3) or if the above speed check is not fulfilled, apply ΔW correction from line 3 and ΔV1/ΔVR/ΔV2 corrections from line 4. No speed check is required.

Note:
- *QNH correction is given for ±10 hPa. It is allowed to extrapolate linearly for greater QNH deviation.*
- *When using a takeoff chart with failure cases, it is not allowed to combine two failure cases.*
- *Corrections from the chart must be applied from top to bottom, i.e. in the RTOW (Refer to PER-TOF-TOC-16-30 RTOW EXAMPLE), apply the wet correction first.*
- *If asterisk or dotted lines appear in the correction boxes, refer to more conservative corrections provided in the FCOM.*
- *No speed check is required for the first correction. However, if the first influence correction follows a conservative FCOM correction, a speed check is required.*

EXAMPLE B

DATA : CONF 1+F

OAT = 45 °C
Head wind = 10 kt
QNH = 998 hPa
WET runway

In this example, we will consider CONF 1+F as takeoff configuration. But same computation has to be done in CONF 2 and you must retain the best configuration.
Use the chart *Refer to PER-TOF-TOC-16-30 RTOW EXAMPLE*).

- Enter the 10 kt head wind column CONF 1+F, to read for 45 °C max TO weight (1 000 kg).....80.6
- Read associated speeds as V1 = 155 kt, VR = 156 kt, V2 = 158 kt
- Apply WET correction

For OAT < TVMC (69 °C), ΔW =..... – 0.7
Intermediate weight (1 000 kg).....= 79.9
Associated speeds,
V1 = 155 kt – 8 = 147 kt
VR = 156 kt – 2 = 154 kt
V2 = 158 kt – 2 = 156 kt
(No speed check required for first correction)

- Apply QNH correction

For OAT < TVMC (61 °C), ΔW = – 0.7 × 15/10 =.....– 1
Maximum permissible takeoff weight (1 000 kg)..... = 78.9
Associated speeds,
V1 = 147 kt – 1 × 15/10 = 145 kt
VR = 154 kt – 1 × 15/10 = 153 kt
V2 = 156 kt – 1 × 15/10 = 155 kt

- Check that the speeds are higher than minimum speeds from the chart and from VMU table (*Refer to PER-TOF-TOD-25-20 MINIMUM V2 LIMITED BY VMU/VMCA (KT IAS)*).
  It is reminded that if the speed checks are not fulfilled, the corrections must be recalculated using those provided on lines 3 and 4.

	Takeoff Configuration: 1 + F			
	TOW	**V1**	**VR**	**V2**

COMBINING CORRECTIONS FROM FCOM AND CHART

Ident.: PER-TOF-TOC-18-10-00014722.0001001 / 29 JUL 16
Applicable to: ALL

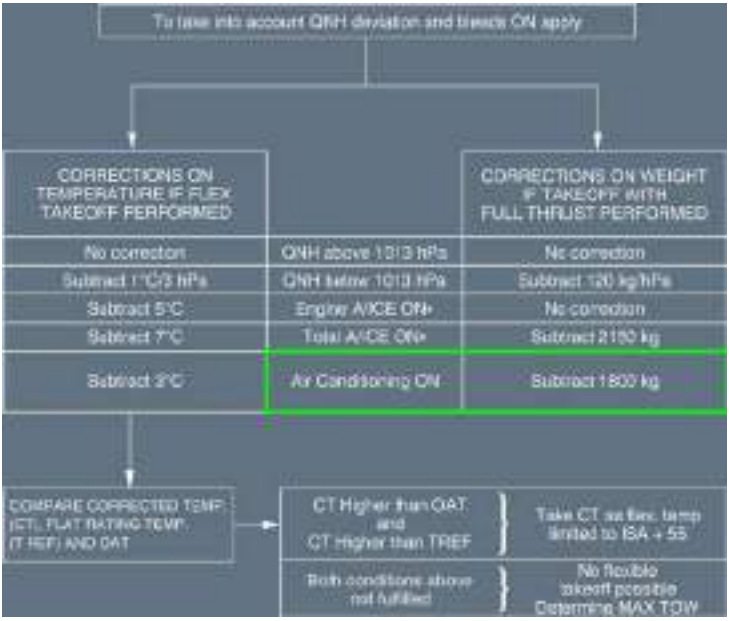
The following data and graphs are for example only, and are not for operational use. Even if the data in the following example is in “kg” and “m”, the same method can be applied for “lb” and “ft”.

Proceed as follows:

1. Determine the maximum takeoff weight by entering the chart with selected configuration, OAT and wind.
2. Apply corrections from FCOM to determine an intermediate weight. Interpolate associated speeds for intermediate weight in the same column (same wind and configuration).
3. Apply corrections from RTOW chart as explained above.

EXAMPLE C

DATA : OAT = 25 °C
CONF 1+F
Head wind = 10 kt
Air conditioning ON
QNH = 998 hPa
WET runway



In this example, we will consider CONF 1+F as takeoff configuration. But same computation has to be done in CONF 2 and you must retain the best configuration.

1. Use the chart (*Refer to PER-TOF-TOC-16-30 RTOW EXAMPLE*).

Enter the 10 kt head wind column CONF 1 + F, to read for 25 °C
MAX TO weight (1 000 kg) air conditioning OFF = 80.6 + 0.46 × 1 + 0.06 × 19 = 82.2
In this example, Tref is equal to 44 °C, therefore the correction for 25 °C is 19 × GRAD1 correction (60kg) + 1 × GRAD2 correction(460kg).

2. First, apply the QNH/BLEEDS correction (*Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS*).

Max TO weight (1 000 kg) air conditioning OFF..... 82.2
Air conditioning correction..... -1.8
Intermediate weight..... = 80.4
Interpolate takeoff speeds for 80.4 (1 000 kg) in the 10 kt head wind column,
V1 = 155 kt, VR = 156 kt, V2 = 158 kt

3. Apply WET correction

For OAT < TVMC (69 °C), ΔW =..... -0.7
Intermediate weight..... = 79.7
Associated speeds,
V1 = 155 kt - 8 = 147 kt
VR = 156 kt - 2 = 154 kt
V2 = 158 kt - 2 = 156 kt
Apply QNH correction

For OAT < TVMC (61 °C), ΔW = -0.7 × 15/10 =..... -1
Maximum permissible takeoff weight.....= 78.7
Associated speed,
V1 = 147 kt - 1 × 15/10 = 145 kt
VR = 154 kt - 1 × 15/10 = 153 kt
V2 = 156 kt - 1 × 15/10 = 155 kt

Check that the speeds are higher than minimum speeds from the chart and from VMU table (*Refer to PER-TOF-TOD-25-20 MINIMUM V2 LIMITED BY VMU/VMCA (KT IAS)*).It is reminded that if the speed checks are not fulfilled, the corrections must be recalculated using those provided on lines 3 and 4.

Since the speed check is fulfilled:
MAX permissible takeoff weight = 78.7 (1 000 kg)
V1 = 145 kt, VR = 153 kt, V2 = 155 kt.

	Takeoff Configuration: 1 + F			
	TOW	**V1**	**VR**	**V2**
TOW (RTOW)	82.2			
FCOM correction(s)	-1.8			
Intermediate value	80.4	155	156	158

Continued on the following page

Continued from the previous page

	Takeoff Configuration: 1 + F			
	TOW	**V1**	**VR**	**V2**
WET Correction	-0.7	-9	-2	-2
Intermediate value	79.7	147	154	156

EXTRAPOLATION

Ident.: PER-TOF-TOC-18-20-00001740.0001001 / 10 DEC 09

1 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

For a takeoff weight lower than those displayed on the chart, associated speeds are calculated as follows :

1. For a given wind, note the speeds associated with the takeoff weight in the row displaying the highest permissible temperature.
2. Apply a speed correction of 1 kt per 1 000 kg (0.5 kt per 1 000 lb) weight decrement to V1, VR and V2 limited to minimum speeds.

EXTRAPOLATION

Ident.: PER-TOF-TOC-18-20-00001740.0002001 / 08 MAR 11

2 **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

For OAT lower than the lowest temperature value of a wind column, it is possible to obtain a higher maximum permissible takeoff weight by using Grad 1/Grad 2 values. *Refer to PER-TOF-TOC-18-10 MTOW DETERMINATION* for more details.

Intentionally left blank

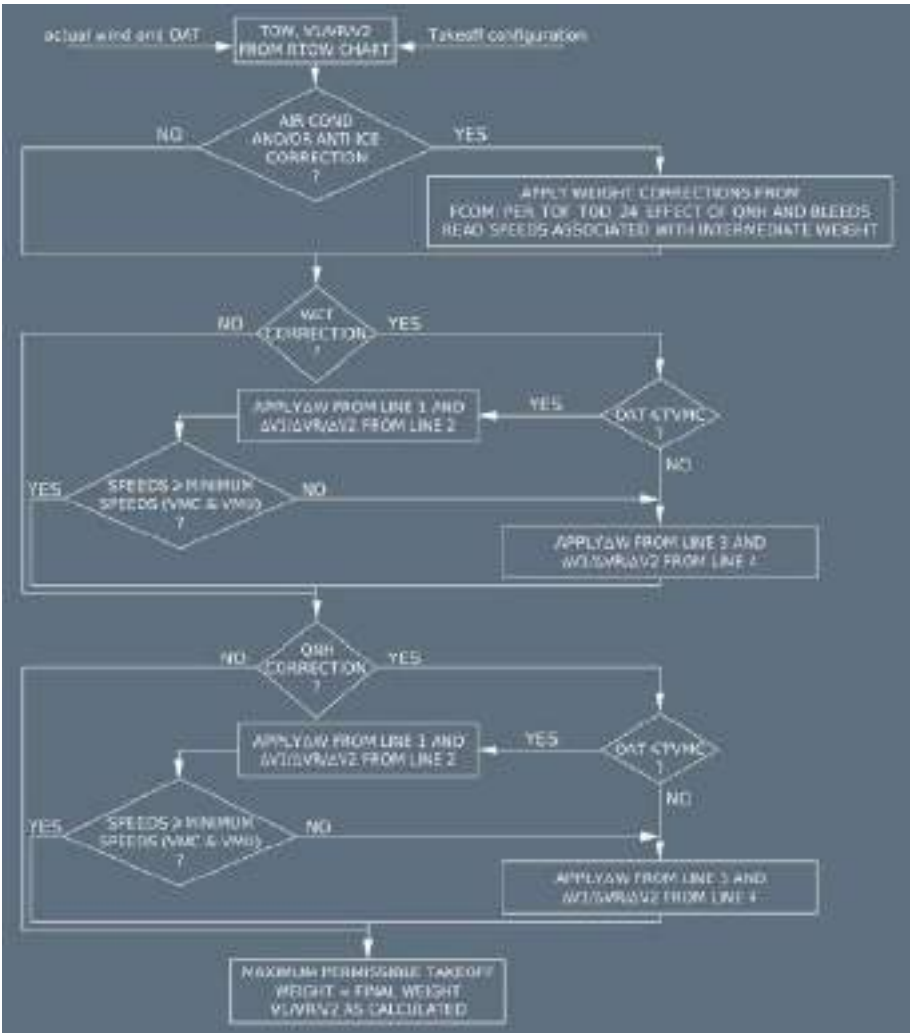
MAXIMUM STRUCTURAL TAKEOFF WEIGHT

MAXIMUM STRUCTURAL TAKEOFF WEIGHT

Ident.: PER-TOF-TOC-18-30-00001741.0001001 / 01 MAR 11
Applicable to: ALL

The maximum structural takeoff weight is a weight limitation depending on the aircraft. This limitation is provided in the Flight Manual and in the limitation chapter (*Refer to LIM-AG-WGHT Weight Limitations*).

Compare the maximum structural takeoff weight to the maximum permissible takeoff weight computed for given conditions and retain the lower of the two values.



Intentionally left blank

SUMMARY

SUMMARY

Ident.: PER-TOF-TOC-18-40-00006114.0001001 / 17 MAR 11
Applicable to: ALL

The following flow diagram gives the different steps to follow.

DETERMINATION OF FLEXIBLE TAKEOFF TEMPERATURE AND SPEEDS

GENERAL

Ident.: PER-TOF-TOC-20-10-00013509.0002001 / 23 FEB 11
Applicable to: ALL

Before determining the flexible temperature, calculate the maximum permissible takeoff weight (see previous section) and ensure that the actual takeoff weight is lower than the determined maximum takeoff weight.

- For a given configuration and wind value, enter the RTOW chart with the actual takeoff weight to read the flexible temperature and associated speeds. It is reminded that the takeoff weight is the sum of the weight entry and the delta weight displayed in each box. It is allowed to interpolate between two consecutive rows and/or columns for weight and for wind values not displayed on the chart.
- Repeat this process for the other configuration available. Select that configuration giving the highest flexible temperature.

CORRECTIONS DUE TO DIFFERENT TAKEOFF CONDITIONS

Ident.: PER-TOF-TOC-20-10-00013506.0001001 / 12 MAY 16
1 **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

When the takeoff conditions are different from those provided on the chart, apply the associated corrections.

Note: - *If the RTOW chart is based on the CG being at 25 %, the crew can determine the flexible temperature at a more forward CG by decreasing the flexible temperature by 2 °C. V1, VR and V2 must be increased by 1 kt.*
- *25 % CG is the basic certified limit, on which all takeoff computation are based. To take into account the operational margins, the above penalties must be applied when operational CG is forward 27 %CG.*

CORRECTIONS DUE TO DIFFERENT TAKEOFF CONDITIONS

Ident.: PER-TOF-TOC-20-10-00013506.0002001 / 23 FEB 11
2 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

When the takeoff conditions are different from those provided on the chart, apply the associated corrections.

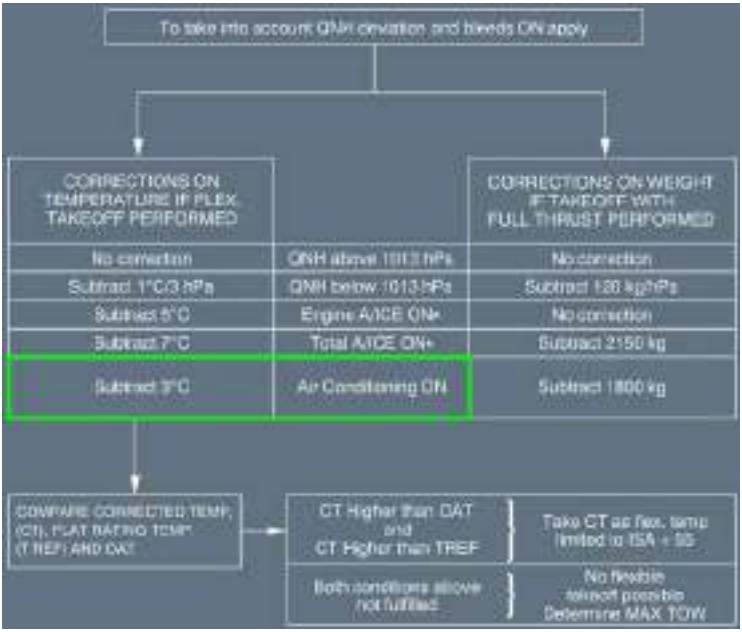
CONSERVATIVE CORRECTIONS FOR QNH AND BLEEDS

Ident.: PER-TOF-TOC-20-10-00014723.0001001 / 29 JUL 16
Applicable to: ALL

The following data and graphs are for example only, and are not for operational use. Even if the data in the following example is in “kg” and “m”, the same method can be applied for “lb” and “ft”.

Corrections are given for QNH ≠ 1 013 hPa, air conditioning ON, anti ice ON.

1. For a given takeoff weight and wind condition, read the flexible temperature. Retain the takeoff speeds associated with the actual weight.
2. Apply the published temperature correction. To combine two or more corrections, add the different corrections and apply to temperature value.
   (No speed corrections required).



EXAMPLE D

DATA : Actual takeoff weight = 68 000 kg
Head wind = 10 kt
Air conditioning ON
QNH = 1 013 hPa

Use the chart from *Refer to PER-TOF-TOC-16-30 RTOW EXAMPLE*. Determine the maximum permissible takeoff weight. The actual weight being lower than the maximum one, flexible takeoff is possible.

Enter the 10 kt head wind column and interpolate for 68 000 kg, CONF 1 + F,
Flexible temperature.....67 °C
Enter the 10 kt head wind column and interpolate for 68 000 kg, CONF 2,
Flexible temperature.....66 °C
Retain CONF 1 + F for takeoff configuration.
Takeoff speeds are V1 = 153 kt, VR = 153 kt, V2 = 154 kt
Flexible temperature with air conditioning OFF.....67 °C
Use the QNH/BLEEDS corrections (*Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS*):

Air conditioning correction.....-3 °C
Flexible temperature.....= 64 °C

CORRECTIONS FOR WET RUNWAY

Ident.: PER-TOF-TOC-20-10-00013280.0001001 / 18 FEB 11
Applicable to: ALL

Refer to PER-TOF-CTA-10 GENERAL

CORRECTIONS PRODUCED ON THE RTOW CHART

Ident.: PER-TOF-TOC-20-10-00014724.0001001 / 29 JUL 16
Applicable to: ALL

The following data and graphs are for example only, and are not for operational use. Even if the data in the following example is in “kg” and “m”, the same method can be applied for “lb” and “ft”.
A description of this correction is given on *Refer to PER-TOF-TOC-16-20 CORRECTIONS DUE TO DIFFERENT TAKEOFF CONDITIONS*. The list of corrections is not exhaustive, however the most commonly used corrections are wet runway, QNH, air conditioning and/or anti-icing. A maximum of three corrections can be produced on one chart.

To apply the correction, proceed as follows:

1. Enter the chart with selected configuration, wind and actual takeoff weight to read the flexible temperature associated with this weight.
2. Apply the first correction:
   If the flexible temperature is less than or equal to TVMC (line 3), apply ΔTflex correction from line 1 and apply speed corrections (ΔV1/ΔVR/ΔV2) from line 2.
   Else, (flexible temperature greater than TVMC), apply ΔTflex from line 3 and ΔV1/ ΔVR/ ΔV2 corrections from line 4.
   Check V2 against VMU limitation (*Refer to PER-TOF-TOD-25-20 MINIMUM V2 LIMITED BY VMU/VMCA (KT IAS)*). If V2 is lower than V2 limited by VMU, flexible takeoff is not possible. Set TOGA thrust and retain the speeds associated with maximum permissible takeoff weight or the speeds read in the chart for the actual weight if they are all lower.
   No speed correction is required for QNH and bleeds influence (Not applicable to maximum takeoff weight determination).
3. To combine a second and/or a third correction, proceed as per point 2.
4. Check that the final flexible temperature is:
   - Higher than OAT and TREF
   - Limited to TMAX FLEX

   If the check is fulfilled, retain final flexible temperature as the one to be inserted in the MCDU
   If the check is not fulfilled, (final flexible temperature lower than OAT or TREF), no flexible takeoff is possible.
   Use TOGA thrust and retain speeds that have been calculated for the maximum permissible takeoff weight. (*Refer to PER-TOF-TOC-20-20 FLEXIBLE TAKEOFF NOT POSSIBLE*)

Note: - *QNH correction is given for ± 10 hPa . It is allowed to extrapolate linearly for greater QNH deviation.*
- *Corrections from the chart must be applied from the top to bottom, i.e in the RTOW on Refer to PER-TOF-TOC-16-30 RTOW EXAMPLE, apply the wet influence first*

Note: - *When the flexible temperature is higher than TVMC, it is allowed to limit the flexible temperature to TVMC and apply only corrections from lines 1 and 2.*

- *If asterisk or dotted lines appear in the correction boxes, refer to more conservative corrections provided in the FCOM.*

EXAMPLE E

DATA : CONF 1+F
Actual takeoff weight = 68 000 kg
Head wind = 10 kt
QNH = 998 hPa
WET runway
Air conditioning OFF

In this example, we will consider CONF 1+F as takeoff configuration. But same computation has to be done in CONF 2 and you must retain the best configuration.
Use the chart from *Refer to PER-TOF-TOC-16-30 RTOW EXAMPLE*.
Determine the maximum permissible takeoff weight.
The actual weight being lower than the maximum one, flexible takeoff is possible.

Enter the 10 kt head wind column and interpolate for 68 000 kg, CONF 1+F,
Flexible temperature..... 67 °C

Takeoff speeds are V1 = 153 kt, VR = 153 kt, V2 = 154 kt
Apply WET correction

For flexible temperature < TVMC (69 °C), ΔTflex =.....-2 °C
Intermediate flex temperature..... = 65 °C

Associated speeds,
V1 = 153 kt – 8 = 145 kt
VR = 153 kt –2 = 151 kt
V2 = 154 kt – 2 = 152 kt

Check V2 against VMU limitation (*Refer to PER-TOF-TOD-25-20 MINIMUM V2 LIMITED BY VMU/VMCA (KT IAS)*).It is reminded that if the speed checks are not fulfilled, the corrections must be recalculated using those provided on lines 3 and 4.
Apply QNH correction

For flex temperature ≥ TVMC (61 °C), ΔTflex = -2 x 15/10 =.....-3 °C
Flexible temperature.....= 62 °C
No speed correction is required for QNH and bleed influence.
Takeoff speeds are V1 = 145 kt, VR = 151 kt, V2 = 152 kt
Check that OAT/TREF < flex temperature ≤ TMAXFLEX.
TMAXFLEX is specified in LIM-70.
For this example, if TMAXFLEX is equal to ISA + 45 °C (60 °C at airport elevation), Flex takeoff is not possible.

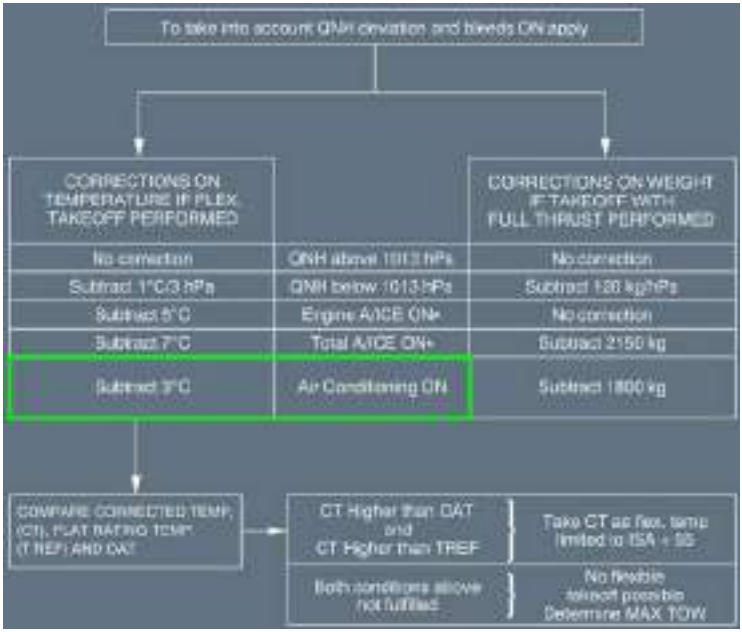
	Takeoff Configuration : 1 + F			
	Tflex	**V1**	**VR**	**V2**
Chart temperature	67	153	153	154
FCOM correction(s)				
Intermediate value	67	153	153	154
WET Correction	-2	-8	-2	-2
Intermediate value	65	145	151	152
QNH Correction	-3	0	0	0
Final value	62	145	151	152

COMBINING CORRECTIONS FROM FCOM AND CHART

Ident.: PER-TOF-TOC-20-10-00014725.0001001 / 29 JUL 16
Applicable to: ALL

The following data and graphs are for example only, and are not for operational use. Even if the data in the following example is in “kg” and “m”, the same method can be applied for “lb” and “ft”.

1. Apply corrections from FCOM (*Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS*).
2. Apply corrections from the RTOW chart.
   Apply speed corrections except for QNH and bleed influences.



EXAMPLE F

DATA : Actual takeoff weight = 68 000 kg
CONF 1+F
Head wind = 10 kt
Air conditioning ON
QNH = 998 hPa
WET runway

In this example, we will consider CONF 1+F as takeoff configuration. But same computation has to be done in CONF 2 and you must retain the best configuration.
Use the chart (*Refer to PER-TOF-TOC-16-30 RTOW EXAMPLE*).
Determine the maximum permissible takeoff weight (see example C). The actual weight being lower than the maximum one, flexible takeoff is possible.

- Enter the 10 kt head wind column and interpolate for 68 000 kg, CONF 1+F, Flexible temperature..... 67 °C
- Takeoff speeds are V1 = 153 kt, VR = 153 kt, V2 = 154 kt
- First, apply the correction from FCOM (*Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS*).

Flexible temperature with air conditioning OFF.....67 °C
Air conditioning correction.....-3 °C
Intermediate flexible temperature.....= 64 °C
No speed correction.

- Apply WET correction

For flexible temperature < TVMC (69 °C), ΔTflex =.....-2 °C
Intermediate flex temperature..... = 62 °C
Associated speeds,
V1 = 153 kt - 8 = 145 kt
VR = 153 kt - 2 = 151 kt
V2 = 154 kt - 2 = 152 kt
Check V2 against VMU limitation on FCOM*Refer to PER-TOF-TOD-25-10 SPEEDS LIMITED BY VMCG/VMCA*.
It is reminded that if the speed checks are not fulfilled, the corrections must be recalculated using those provided on lines 3 and 4.

- Apply QNH correction

For flexible temperature ≥ TVMC (61 °C), ΔTflex = -2 x 15/10 = ...-3 °C
Flexible temperature.....= 59 °C
No speed correction is required for QNH and bleed influence.
Takeoff speeds are V1 = 145 kt, VR = 151 kt, V2 = 152 kt
Check that OAT/TREF < flex temperature ≤ TMAXFLEX
TMAXFLEX is specified in LIM-70.

	Takeoff Configuration : 1 + F			
	Tflex	**V1**	**VR**	**V2**
Chart temperature	67	153	153	154
FCOM correction(s)	-3	0	0	0
Intermediate value	64	153	153	154
WET Correction	-2	-8	-2	-2
Intermediate value	62	145	151	152
QNH Correction	-3	0	0	0
Final value	59	145	151	152

Intentionally left blank

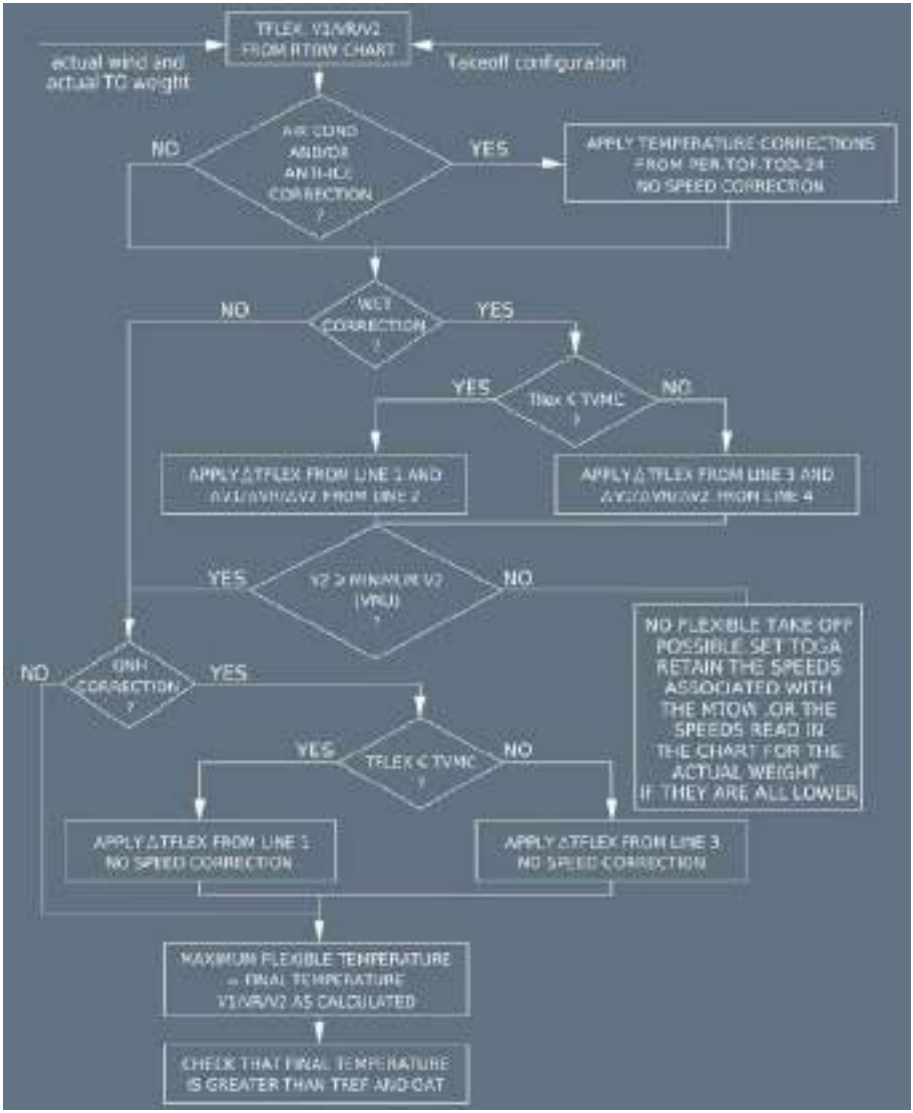
FLEXIBLE TAKEOFF NOT POSSIBLE

FLEXIBLE TAKEOFF NOT POSSIBLE

Ident.: PER-TOF-TOC-20-20-00013281.0001001 / 18 FEB 11
Applicable to: ALL

In some cases when the actual takeoff weight is lower than the maximum permissible one but no flexible takeoff possible (that is flexible temperature lower than TREF or OAT):

- It is mandatory to use TOGA thrust
- You can retain the speeds that have been calculated for the maximum permissible takeoff weight; OR
- You can retain the speeds associated with the actual takeoff weight provided they are all lower than the speeds calculated for the maximum permissible takeoff weight.



Intentionally left blank

Applicable to: ALL

TAKEOFF CHART DATA

The following data and graphs are for example only, and are not for operational use. Even if the data in the following example is in “kg” and “m”, the same method can be applied for “lb” and “ft”.
Airport geometric elevation = 450 ft
QNH = 1 013 hPa
Anti ice OFF
Air conditioning OFF

EXAMPLE 1 - FULL THRUST TAKEOFF

Actual data : OAT = 5 °C
QNH = 998 hPa
Engine anti ice ON
Air conditioning OFF

Weight read in the takeoff chart: 73 000 kg.
Use the QNH/BLEEDS corrections (*Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS*) or (*Refer to PER-TOF-TOD-24 EFFECT OF QNH AND BLEEDS FOR HIGH ALTITUDE OPERATIONS*) for high altitude operations.

Read in the above table the corrections for high QNH and engine anti ice ON.
QNH correction: 120 kg x (1013 - 998) = 1 800 kg
Engine anti ice correction: No correction.
The maximum permissible takeoff weight is 73 000 - 1800 - 0 = 71 200 kg

EXAMPLE 2 - FLEXIBLE THRUST TAKEOFF

Actual data : OAT = 5 °C
QNH = 1 004 hPa
Anti ice OFF
Air conditioning ON
TOW = 65 000 kg

Flexible temperature read on the takeoff chart: TFLEX = 55 °C.
Read TREF on the takeoff chart or on the quick reference table.
Read in the above table the correction for QNH and air conditioning ON:
QNH correction = 1 °C / 3 hPa x (1 004 - 1 013) = -3 °C
Air conditioning ON correction: -3 °C
New flexible temperature = 55 - 3 - 3 = 49 °C
Check that the flexible temperature is above TREF and actual OAT.

Check that the flexible temperature is less than the maximum flexible temperature.

EFFECT OF QNH AND BLEEDS FOR HIGH ALTITUDE OPERATIONS

Either condition above not fulfilled	->	No flexible takeoff possible. Determine MAX TOW

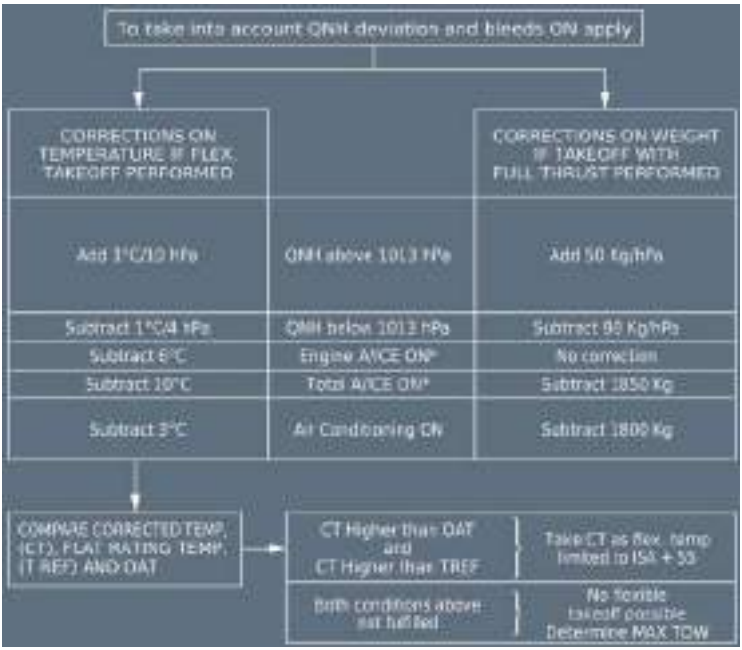
EFFECT OF QNH AND BLEEDS FOR HIGH ALTITUDE OPERATIONS (ABOVE 9200 FT)

Ident.: PER-TOF-TOD-24-00012926.0240001 / 23 JUN 15
Applicable to: MSN 05437-06336

To take into account QNH deviation and/or bleeds ON apply

CORRECTIONS ON TEMPERATURE IF FLEX TAKEOFF IS PERFORMED		CORRECTIONS ON WEIGHT IF TAKEOFF WITH FULL THRUST IS PERFORMED
Add 1 °C/13 hPa	QNH above 1 013 hPa	Add 40 kg/hPa
Substract 1 °C/3 hPa	QNH below 1 013 hPa	Substract 90 kg/hPa
Substract 8 °C	Engine A/ICE ON	No correction
Substract 12 °C	Total A/ICE ON	Substract 1 900 kg
Substract 6 °C	Air Conditioning ON	Substract 1 800 kg



Compare corrected temp (CT), flat rating temp (TREF) and OAT		
CT higher than OAT and CT higher than TREF	->	Take CT as flex temp limited to ISA+55
Either condition above not fulfilled	->	No flexible takeoff possible. Determine MAX TOW

Note: ** Corrections valid only for OAT < 10 °C*

EXAMPLES FOR HIGH ALTITUDE OPERATIONS

Ident.: PER-TOF-TOD-24-00012925.0064001 / 18 MAR 11
Applicable to: MSN 02443, 02670, 02908-02914, 03308, 03357-03618, 03782-04216, 04312, 04328-04384, 04481-04488, 04506, 04518, 04535-04637, 04752-05094, 05155, 05190, 05230-06336

TAKEOFF CHART DATA

Airport geometric elevation = 11 500 ft
QNH = 1 013 hPa
Anti ice OFF
Air conditioning OFF
OAT = 0 °C
MTOW = 73 000 kg

EXAMPLE 1 - FULL THRUST TAKEOFF

Actual data : QNH = 1 040 hPa
Engine anti ice ON
Air conditioning OFF

Determine the actual airport pressure altitude (1 hPa is equivalent to 28 ft according to the ISA model).
Pressure altitude = 11 500 - (1 040 - 1 013) × 28 = 10 744 ft
Read in the above table the corrections for high QNH and engine anti ice ON.
QNH correction = 50 kg × (11 500 - 10 744)/28 hPa = +1 350 kg
Engine anti ice correction: 0 kg
The maximum permissible takeoff weight is 73 000 + 1 350 - 0 = 74 350 kg

EXAMPLE 2 - FLEXIBLE THRUST TAKEOFF

Actual data : QNH = 1 040 hPa
Anti ice OFF
Air conditioning ON
TOW = 65 000 kg
TFLEX = 55 °C

Read TREF on the takeoff chart or on the quick reference table.
Determine the actual airport pressure altitude (1 hPa is equivalent to 28 ft according to the ISA model).
Pressure altitude = 11 500 - (1 040 - 1 013) × 28 = 10 744 ft
Read in the above table the correction for QNH and air conditioning ON:
QNH correction = 1 °C/10 hPa × (11 500 - 10 744)/28 hPa = +3 °C
Air conditioning ON correction = -3 °C
New flexible temperature = 55 + 3 - 3 = 55 °C
Check that the flexible temperature is above TREF and actual OAT.

Check that the flexible temperature is less than the maximum flexible temperature and retain the lower of the two.

EXAMPLES FOR HIGH ALTITUDE OPERATIONS

Ident.: PER-TOF-TOD-24-00012925.0070001 / 18 MAR 11
Applicable to: MSN 03750, 04399, 04438

TAKEOFF CHART DATA

Airport geometric elevation = 11 500 ft
QNH = 1 013 hPa
Anti ice OFF
Air conditioning OFF
OAT = 0 °C
MTOW = 73 000 kg

EXAMPLE 1 - FULL THRUST TAKEOFF

Actual data : QNH = 1 040 hPa
Engine anti ice ON
Air conditioning OFF

Determine the actual airport pressure altitude (1 hPa is equivalent to 28 ft according to the ISA model).
Pressure altitude = 11 500 - (1 040 - 1 013) x 28 = 10 744 ft
Read in the above table the corrections for high QNH and engine anti ice ON.
QNH correction = 60 kg x (11 500 - 10 744)/28 hPa = +1 620 kg
Engine anti ice correction: 1 800 kg
The maximum permissible takeoff weight is 73 000 + 1 620 - 1 800 = 72 820 kg

EXAMPLE 2 - FLEXIBLE THRUST TAKEOFF

Actual data : QNH = 1 040 hPa
Anti ice OFF
Air conditioning ON
TOW = 65 000 kg
TFLEX = 55 °C

Read TREF on the takeoff chart or on the quick reference table.
Determine the actual airport pressure altitude (1 hPa is equivalent to 28 ft according to the ISA model).
Pressure altitude = 11 500 - (1 040 - 1 013) x 28 = 10 744 ft
Read in the above table the correction for QNH and air conditioning ON:
QNH correction = 1 °C/11 hPa x (11 500 - 10 744)/28 hPa = +3 °C
Air conditioning ON correction = -5 °C
New flexible temperature = 55 + 3 - 5 = 53 °C
Check that the flexible temperature is above TREF and actual OAT.

Check that the flexible temperature is less than the maximum flexible temperature and retain the lower of the two.

The following tables, one per configuration, provide the V2 limited by minimum unstick speed and minimum control speed in the air.

GENERAL

Ident.: PER-TOF-CTA-10-00001781.0001001 / 21 JUL 14
Applicable to: ALL

This section presents the recommendations of Airbus for operations from wet runways or from runways which are covered with contaminants such as standing water, slush or snow.

CAUTION	Takeoff is not recommended: - From an icy runway - From a runway for which the depth of contaminant is greater than the performance levels or the equivalences published in the documentation or performance software.

Intentionally left blank

DEFINITIONS

Ident.: PER-TOF-CTA-20-00001782.0001001 / 03 OCT 17
Applicable to: ALL

DAMP	:	A runway is considered as damp, when the surface of the runway is not dry, but the water on the surface does not cause a shiny appearance.
WET	:	A runway is considered as wet, when the surface of the runway has a shiny appearance due to a thin film of water. When this film does not exceed 3 mm, there is no significant danger of hydroplaning.
FROST	:	The deposit of ice crystals on the runway is referred to as frost. The direct sublimation of humidity contained in the air on a runway, when the surface temperature is below freezing, causes frost.
COMPACTED SNOW	:	The maintenance personnel use a snow groomer to compress snow on a runway in order to obtain a hard surface.
SLIPPERY WHEN WET:		Notice to Airmen (NOTAM) report a runway as "slippery when wet", when the runway partially or entirely fails to satisfy the minimum (regulatory) friction requirement of the responsible authority.
DRY SNOW	:	Dry snow is snow that, if compacted by hand, does not stay compressed when released. The wind can blow dry snow. The density of dry snow is approximately 0.2 kg/l (1.7 lb/US Gal).
WET SNOW	:	Wet snow is snow that, if compacted by hand, stays compressed when released, and with which snowballs can be created. The density of wet snow is approximately 0.4 kg/l (3.35 lb/US Gal).
STANDING WATER	:	Standing water occurs due to heavy rain and/or insufficient runway drainage with a depth of more than 3 mm.
SLUSH	:	Slush is snow soaked with water, which spatters when stepped on firmly. Slush occurs at temperatures around 5 °C and has a density of approximately 0.85 kg/l (7.1 lb/US Gal).
ICE (Cold and Dry)	:	Situation in which ice occurs on the runway in cold and dry conditions.
WET ICE	:	When the ice on a runway melts, or there are loose/fluid contaminants on top of the ice, the ice is referred to as "wet ice". When there is wet ice on a runway, braking and directional control are difficult or not possible, because the runway surface is very slippery.

EQUIVALENCES

Ident.: PER-TOF-CTA-20-00014919.0002001 / 21 JUL 14
Applicable to: ALL

For the below-listed reported contaminants, the following equivalent runway conditions can be retained for the takeoff performance determination.

Reported contaminant		Equivalent Runway Condition
Type of contaminant	**Depth of contaminant**	
Slush	≤ 3 mm (1/8 in)	Wet
Water		
Wet snow		
Dry snow		

OPERATIONAL CONDITIONS

Ident.: PER-TOF-CTA-30-00001783.0001001 / 14 SEP 18
Applicable to: ALL

Performance penalties for takeoff as published in this section are computed with the following assumptions :

- The contaminant is in a layer of uniform depth and density over the entire length of the runway.
- Antiskid and spoilers are operative.
- The friction coefficient is based on studies and checked by actual tests.
- The screen height at the end of takeoff segment is 15 ft, not 35 ft.

In addition, for contaminated runways only :

- There is drag due to rolling resistance of the wheels.
- There is drag due to spray on the airframe and gears.
- Reverse thrust is used for the deceleration phase.
- Maximum thrust is used for takeoff.

Note: The gross flight path clears close-in obstacles by 15 ft instead of 35 ft.

Intentionally left blank

TAKEOFF PERFORMANCE

TAKEOFF PERFORMANCE

Ident.: PER-TOF-CTA-40-10-00013660.0001001 / 04 MAR 11
Applicable to: MSN 06720-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-08864, 08901

CAUTION	The method is based on the use of the RTOW charts established at optimum V2/VS and optimum V1/VR. The method should not be used with takeoff charts computed for other conditions. All tables have been established for TOGA (and Flexible Takeoff for wet runways). Do not use them for Derated thrust.

Correct the determined maximum takeoff weight on dry runway to take into account QNH and bleed effects, then apply the corrections given on the following pages.

Note: *1. On contaminated runway, in some cases, no MTOW can be determined with this method (box dashed below a given weight). A specific RTOW chart must then be computed.*
2. The published corrections are valid for charts calculated with forward CG and basic CG.

TAKEOFF PERFORMANCE

Ident.: PER-TOF-CTA-40-10-00013660.0002001 / 23 JUN 15
1 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

CAUTION	The method is based on the use of the RTOW charts established at optimum V2/VS and optimum V1/VR. In addition, when applying corrections for a wet runway, the RTOW charts should also have been established with V1 min (minimum V1 of the V1 range). The method should not be used with takeoff charts computed for other conditions. All tables have been established for TOGA (and Flexible Takeoff for wet runways). Do not use them for Derated thrust.

Correct the determined maximum takeoff weight on dry runway to take into account QNH and bleed effects, then apply the corrections given on the following pages.

Note: *1. The results obtained with this method may be different from the influence given at the bottom of the RTOW chart.*
2. On contaminated runway, in some cases, no MTOW can be determined with this method (box dashed below a given weight). A specific RTOW chart must then be computed.

TAKEOFF PERFORMANCE

Note:
1. *The results obtained with this method may be different from the influence given at the bottom of the RTOW chart.*
2. *On contaminated runway, in some cases, no MTOW can be determined with this method (box dashed below a given weight). A specific RTOW chart must then be computed.*
3. *The published corrections are valid for charts calculated with forward CG and basic CG.*

TAKEOFF FROM A WET RUNWAY

HOW TO PROCEED

Ident.: PER-TOF-CTA-40-20-00012966.0004001 / 24 MAR 11
Applicable to: ALL

1. Determine the maximum takeoff weight or flexible temperature and associated speeds on dry runway.
2. Two sets of tables are given depending on the use of thrust reversers and the presence of clearway. Select the table to use as applicable to your case.
   The runway length in the table corresponds to the available takeoff run (TORA).
3. Apply the corrections shown in the table to the maximum takeoff weight or flexible temperature and associated speeds determined on dry runway.
4. Check that takeoff speeds are greater than the minimum values shown on the RTOW chart.

   If one or more speeds are lower than these minimum values, apply the following procedure :
   - Actual TOW = maximum TOW
     - If V1 is lower than the minimum V1 (V1 limited by VMCG), take this last value as V1 and further decrease weight by 3 000 kg (6 600 lb) per knot difference between them. Check that VR and V2 are higher than or equal to the minimum values.
     - If VR or/and V2 falls below the minimum values, takeoff is not possible.
   - Actual TOW lower than maximum TOW
     - If V1 corresponding to actual TOW is lower than the minimum V1 (V1 limited by VMCG) :
       - If maximum TOW has a V1 equal to or above minimum V1, retain minimum V1 as V1 and decrease the flexible temperature by 4 °C per knot difference between them.
       - In the rare case when the V1 corresponding to maximum TOW falls below the minimum V1, decrease maximum TOW by 3 000 kg (6 600 lb) per knot difference between them. Limit the actual TOW to the value found after this decrement. Take V1 equal to minimum V1 and decrease the flexible temperature by 4 °C per knot difference between this last value and the V1 corresponding to the actual TOW. Check that VR and V2 are higher than or equal to the minimum values.
     - If VR or V2 corresponding to actual TOW falls below the minimum values, and if VR and V2 corresponding to maximum TOW are above the minimum values, retain the minimum speed value for VR and V2.

5. Check that V2 is above the minimum V2 value due to VMU (*Refer to PER-TOF-TOD-25-10 SPEEDS LIMITED BY VMCG/VMCA*).
6. Check that the corrected flexible temperature is higher than OAT and Tref.

Note: - Do not extrapolate below the shortest runway length provided in the table.

- *If no minimum speed value is available, use the conservative values provided on Refer to PER-TOF-TOD-25-10 SPEEDS LIMITED BY VMCG/VMCA.*

EXAMPLE

TAKEOFF PERFORMANCE ON DRY RUNWAY

Ident.: PER-TOF-CTA-40-40-00014730.0001001 / 29 JUL 16
Applicable to: ALL

DATA

The following data and graph are for example only, and are not for operational use. Even if the data in the following example is in "kg" and "m", the same method can be applied for "lb" and "ft".
Runway length : 3 000 m, OAT = 36 °C, no wind, CONF 1+F
Determine maximum takeoff weight on dry runway from RTOW chart (*Refer to PER-TOF-TOC-10-30 EXAMPLE OF TAKEOFF CHART*).

OAT	CONF 1 + F				
°C	TAILWIND -10 KT	TAILWIND -5 KT	WIND 0 KT	HEADWIND 10 KT	HEADWIND 20 KT
34.0	76.7 4/8 145/50/52	78.4 4/8 148/53/55	80.2 4/8 154/56/58	81.5 4/8 157/57/60	82.8 4/8 160/60/62
36.0	76.6 4/8 143/49/52	78.4 4/8 148/52/54	80.1 4/8 153/56/58	81.4 4/8 156/57/59	82.7 4/8 159/60/62

Maximum TOW = 80 100 kg, V1 = 153 kt, VR = 156 kt, V2 = 158 kt.

TAKEOFF PERFORMANCE ON WET RUNWAY

Ident.: PER-TOF-CTA-40-40-00014731.0001001 / 29 JUL 16
Applicable to: ALL

The following data and graphs are for example only, and are not for operational use. Even if the data in the following example is in “kg” and “m”, the same method can be applied for “lb” and “ft”.
With no thrust reversers operating and assuming that no clearway was used to compute the dry RTOW chart, use the table *Refer to PER-TOF-CTA-40-20 NO THRUST REVERSERS OPERATIVE (NO CLEARWAY)*.

- Maximum takeoff weight correction :
  MTOW = 80 100 - 900 = 79 200 kg, V1 = 153 - 16 = 137 kt, VR = 156 - 3 = 153 kt, V2 = 158 - 3 = 155 kt.
- Flex temperature correction :
  Assuming an actual takeoff weight of 75 000 kg and an initial flex temperature of 53 °C
  TOW = 75 000 kg ⇒ Flex temperature = 53 - 3 = 50 °C
  V1 = 152 - 16 = 136 kt, VR = 153 - 3 = 150 kt, V2 = 154 - 3 = 151 kt.

Check the resulting speeds against the minimum speeds as per procedure *Refer to PER-TOF-CTA-40-20 HOW TO PROCEED*.

MINIMUM RECOMMENDED FUEL REQUIREMENTS

Ident.: PER-FPL-GEN-MFR-00001837.0006001 / 25 JAN 17

[1] **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

The total fuel quantity required to fly a given sector is the sum of the following quantities:

TAXI FUEL

Quantity required for startup and taxi. Fuel calculation is based on a consumption of 10.3 kg/min or 23 lb/min.
Average quantity (14 min) → 164 kg or 362 lb.

TRIP FUEL

Fuel required from departure to destination includes the following quantities:
- Takeoff and climb at selected speed
- Cruise at selected speed
- Descent from cruising level to 1 500 ft above destination airport
- Approach and landing. Fuel calculation is based on a consumption of 23 kg/min or 50 lb/min
  Average quantity (6 min IFR) →140 kg or 310 lb.

RESERVE FUEL

This quantity includes :

"EN ROUTE" RESERVE FUEL (CONTINGENCY FUEL)

- According to national regulations and company policy (generally based on a percentage of trip fuel).

ALTERNATE FUEL

Fuel required to fly from destination to alternate airport.
It includes go-around 100 kg or 220 lb, climb to cruising level, cruise at long range speed, descent and approach procedure.
120 kg or 270 lb for 4 min VFR.

HOLDING FUEL

Calculation of holding fuel should take into account the altitude of the alternate and the landing weight at the alternate. To use holding charts *Refer to PER-HLD-GEN GENERAL*.
A conservative quantity corresponding to a 30 min holding at 1 500 ft above alternate airport elevation at "green dot" speed in the clean configuration is 1 450 kg or 3 200 lb.

APU FUEL

During ground operations, APU fuel consumption is about 130 kg/h or 290 lb/h (Packs ON, 90 KVA load on APU GEN).

MINIMUM RECOMMENDED FUEL REQUIREMENTS

Ident.: PER-FPL-GEN-MFR-00001837.0001001 / 08 FEB 11

[2] **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

The total fuel quantity required to fly a given sector is the sum of the following quantities:

TAXI FUEL

Quantity required for startup and taxi. Fuel calculation is based on a consumption of 11.5 kg/min or 25 lb/min
Average quantity (12 min) → 140 kg or 300 lb

TRIP FUEL

Fuel required from departure to destination includes the following quantities:
- Takeoff and climb at selected speed.
- Cruise at selected speed.
- Descent from cruising level to 1 500 ft above destination airport.
- Approach and landing. Fuel calculation is based on a consumption of 20 kg/min or 45 lb/min
  Average quantity (6 min IFR) →120 kg or 270 lb

RESERVE FUEL

This quantity includes :

"EN ROUTE" RESERVE FUEL (CONTINGENCY FUEL)

- According to national regulations and company policy (generally based on a percentage of trip fuel).

ALTERNATE FUEL

- Fuel required to fly from destination to alternate airport.

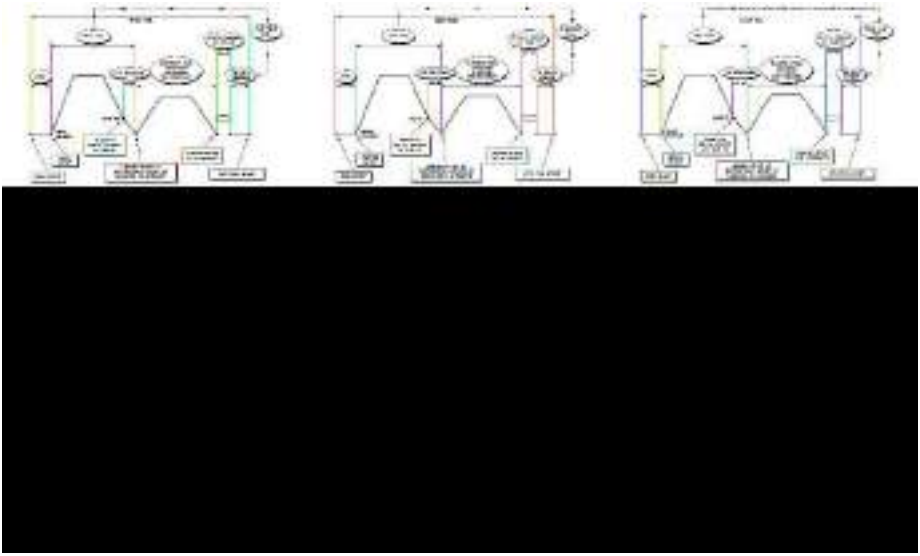
It includes go-around 100 kg or 220 lb, climb to cruising level, cruise at long range speed, descent and approach procedure.
80 kg or 180 lb for 4 min VFR

HOLDING FUEL

Calculation of holding fuel should take into account the altitude of the alternate and the landing weight at the alternate. To use holding charts *Refer to PER-HLD-GEN GENERAL*.
A conservative quantity corresponding to a 30 min holding at 1 500 ft above alternate airport elevation at "green dot" speed in the clean configuration is 1 200 kg or 2 700 lb

APU FUEL

During ground operations, APU fuel consumption is about 130 kg/h or 290 lb/h (Packs ON, 90 KVA load on APU GEN).



FLIGHT PLAN

Ident.: PER-FPL-GEN-FPL-00001835.0001001 / 22 MAR 11
Applicable to: ALL

When no precalculated flight plan is available, flight planning can be determined by using the tables given in this chapter.

Fuel policy will be the same as for precalculated flight plan.

The graph on the following page defines the different terms used in this chapter.

Intentionally left blank

INTRODUCTION

INTRODUCTION

Ident.: PER-FPL-FLP-QFP-10-00001827.0001001 / 25 FEB 11

[1] **Applicable to: MSN 01957-02359, 02405-02482, 02609-02670, 02737-03071, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

The following flight planning tables allow the planner to determine trip fuel consumption and trip time required to cover a given air distance.

These tables are established for:
- Takeoff
- Climb profile 250 kt/300 kt/M 0.78
- Cruise Mach number M 0.78/LR
- Descent profile M 0.78/300 kt/250 kt
- Approach and landing 120 kg - 6 min IFR
- ISA
- CG = 33 %
- Normal air conditioning
- Anti ice OFF

They are based upon a reference landing weight of 55 000 kg.

Note: *1. In the tables, the asterisk (*) means that a step climb of 4 000 ft must be flown to reach the corresponding FL.*
2. To obtain a flight plan at optimum cruise level, the highest flight level desired within the flight has to be selected in the table.
3. For each degree Celcius above ISA temperature apply fuel correction 0.015 (kg/°C/NM) x ΔISA (°C) x Air Distance (NM).

INTRODUCTION

Ident.: PER-FPL-FLP-QFP-10-00001827.0032002 / 12 JUL 12

[2] **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

The following flight planning tables allow the planner to determine trip fuel consumption and trip time required to cover a given air distance.

These tables are established for:

- Takeoff
- Climb profile 250 kt/300 kt/M 0.78
- Cruise Mach number M 0.78/LR
- Descent profile M 0.78/300 kt/250 kt
- Approach and landing 140 kg - 6 min IFR
- ISA
- CG = 33 %
- Normal air conditioning
- Anti ice OFF

They are based upon a reference landing weight of 60 000 kg.

Note: *1. In the tables, the asterisk (*) means that a step climb of 4 000 ft must be flown to reach the corresponding FL.*

2. To obtain a flight plan at optimum cruise level, the highest flight level desired within the flight has to be selected in the table.

3. For each degree Celcius above ISA temperature apply fuel correction 0.015 (kg/°C/NM) x ΔISA (°C) x Air Distance (NM).

INTRODUCTION

Ident.: PER-FPL-FLP-QFP-10-00001827.0003001 / 02 MAY 12

Applicable to: MSN 01767-01920, 02388, 02584, 02712, 03138, 03750, 04294, 04314, 04393-04438, 04510

The following flight planning tables allow the planner to determine trip fuel consumption and trip time required to cover a given air distance.

These tables are established for:

- Takeoff
- Climb profile 250 kt/300 kt/M 0.78
- Cruise Mach number M 0.78/LR
- Descent profile M 0.78/300 kt/250 kt
- Approach and landing 120 kg - 6 min IFR
- ISA
- CG = 33 %
- Normal air conditioning
- Anti ice OFF

They are based upon a reference landing weight of 55 000 kg and have been calculated using databases for CFM 56–5–B/P. If the engines fitted on the aircraft are neither /P, nor /3, the fuel consumption has to be increased by 3 %.

Note: *1. In the tables, the asterisk (*) means that a step climb of 4 000 ft must be flown to reach the corresponding FL.*

2. To obtain a flight plan at optimum cruise level, the highest flight level desired within the flight has to be selected in the table.

3. For each degree Celcius above ISA temperature apply fuel correction 0.015 (kg/°C/NM) x ΔISA (°C) x Air Distance (NM).

CORRECTION FOR DEVIATION FROM REFERENCE LANDING WEIGHT

CORRECTION FOR DEVIATION FROM REFERENCE LANDING WEIGHT

Ident.: PER-FPL-FLP-QFP-20-00001828.0001001 / 03 MAR 11
Applicable to: ALL

The fuel consumption must be corrected when the actual landing weight is different from the reference landing weight.
If it is lower (or greater) than the reference landing weight, subtract (or add) the value given in the correction part of the table per 1 000 kg below (or above) the reference landing weight.

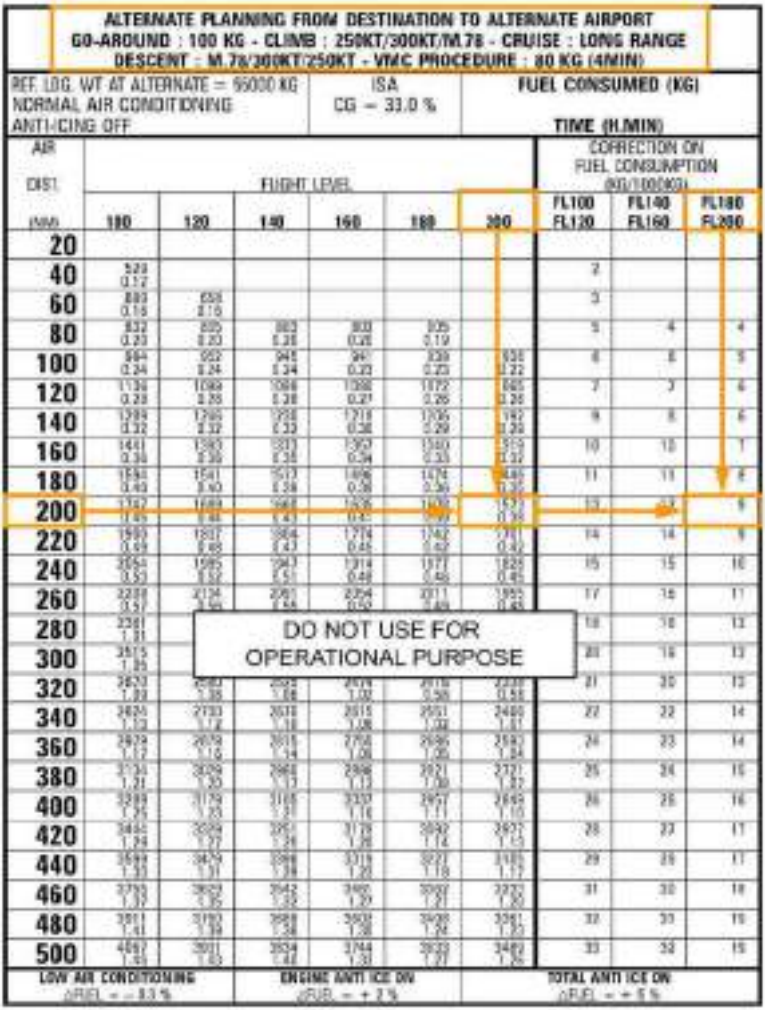
Applicable to: ALL

INTRODUCTION

This section provides an example explaining step by step how to perform a quick planning.
This example is based on an A320-232 aircraft, which most likely does not reflect your actual aircraft. Nevertheless, the principle is valid for any aircraft, provided the appropriate performance tables are used.
For actual calculations, access the appropriate tables corresponding to your current aircraft and desired flight profile by following the "refer to" indications specified at each step, and do not use the tables provided in the example.



EXAMPLE

The example is based on the following parameters:

- Aircraft used for the example	A320-232
- Zero Fuel Weight	60 000 kg
- Temperature	ISA conditions
- Air conditioning	Normal
- Anti-ice	Off
- Cruise	M 0.78 at FL 370
- Departure - destination ground distance	1 800 NM
- Average wind on the leg to destination	-40 kt (headwind)
- Reserve fuel	5 %
- Destination - alternate ground distance	200 NM at FL 200
- Average wind on the leg to alternate	0 kt

To calculate the flight plan, it is necessary to start from the minimum landing fuel at the alternate airport.

1. Determine the 30 minutes holding fuel required at alternate airport (at 1 500 ft AGL).
   (*Refer to PER-FPL-GEN-MFR MINIMUM RECOMMENDED FUEL REQUIREMENTS* for actual 30 min fuel value).
   For the example, the conservative value of 1 200 kg is chosen.
   The resulting landing weight at alternate is 60 000 + 1 200 = 61 200 kg.
2. Determine time, trip fuel, and fuel correction for the leg from destination to alternate airport:

ALTERNATE PLANNING FROM DESTINATION TO ALTERNATE AIRPORT
GO-AROUND : 100 KG - CLIMB : 250KT/300KT/M.78 - CRUISE : LONG RANGE
DESCENT : M.78/300KT/250KT - VMC PROCEDURE : 80 KG (4MIN)

REF. LDG. WT AT ALTERNATE = 95000 KG
NORMAL AIR CONDITIONING
ANTI-ICING OFF

ISA
CG = 33.0 %

FUEL CONSUMED (KG)

TOTAL ANTI ICE ON
ΔFUEL = + 5 %

a. Convert the ground distance to air distance.
   (*Refer to PER-OPD-CON-AEO GENERAL* for conversion).
   On this leg, the average wind is zero. Therefore, the air distance equals the ground distance.
b. Enter the table with the air distance and desired flight level to obtain time, trip fuel, and fuel correction.

(*Refer to PER-FPL-FLP-ALN-20 GENERAL* for actual table).
For 200 NM air distance at FL 200, the table provides 0 h 38 min, 1 573 kg and 9 kg/1 000 kg.

c. Calculate the fuel burn correction regarding the estimated landing weight at the alternate airport.
Table reference weight : 55 000 kg
Estimated landing weight : 61 200 kg
Fuel correction 9 kg per 1 000 kg difference
The extra fuel burn is (61.2 - 55.0) x 9 = 56 kg.

d. Calculate the total trip fuel from destination to alternate.
Trip fuel : 1 573 + 56 = 1 629 kg
The estimated landing weight at destination is 61 200 + 1 629 = 62 829 kg.

3. Determine time, trip fuel, and fuel correction for the leg from departure to destination airport at M 0.78:

FLIGHT PLANNING FROM BRAKE RELEASE TO LANDING
CLIMB : 250KT/300KT/M.78 - CRUISE : M.78 - DESCENT : M.78/300KT/250KT
(MC PROCEDURE : 120 KG (KMIN))

REF. LANDING WEIGHT = 95000 KG

LOW AIR CONDITIONING
ΔFB = - 0.4 %

ENGINE ANTI ICE ON
ΔFB = + 2 %

TOTAL ANTI ICE ON
ΔFB = + 5.5 %

a. Convert the ground distance to air distance.
(*Refer to PER-OPD-CON-AEO GENERAL* for conversion).
For 1 800 NM ground distance and 40 kt headwind at M 0.78, the interpolation from the table provides 1 979 NM air distance.

b. Enter the table with the air distance and desired flight level to obtain time, trip fuel, and fuel correction.
(*Refer to PER-FPL-FLP-QFP-40 FLIGHT PLANNING M.78* for actual M 0.78 table).
For 1 979 NM air distance at FL 370, the interpolation from the M 0.78 table provides 4 h 38 min, 10 226 kg and 146 kg/10 000 kg.

c. Calculate the fuel burn correction regarding the estimated landing weight at the destination airport.
Table reference weight : 55 000 kg
Estimated landing weight : 62 829 kg
Fuel correction 146 kg per 1 000 kg difference
The extra fuel burn is (62.829 - 55) x 146 = 1 143 kg.

d. Calculate the total trip fuel from departure to destination.
Trip fuel : 10 226 + 1 143 = 11 369 kg

4. Determine the contingency (reserve) fuel.
(Refer to company policy for fuel reserve value).
The five percent of the departure - destination trip fuel is:
11 369 x 0.05 = 568 kg.
5. Determine the taxi fuel at departure.
(*Refer to PER-FPL-GEN-MFR MINIMUM RECOMMENDED FUEL REQUIREMENTS* for actual taxi fuel).
For the example, the conservative value of 140 kg (12 min taxi time) is chosen.
6. Calculate the final block fuel.

- 30 min holding at alternate (1 500 ft AGL)	1 200 kg
- Trip fuel to alternate	1 629 kg
- Trip fuel to destination	11 369 kg
- Contingency (reserve) fuel	568 kg
- Taxi fuel	140 kg
Total block fuel	14 906 kg
Block weight	74 906 kg

The alternate planning tables enable the flight crew to determine the fuel consumption and time required to cover a given air distance from go-around at destination airport to landing at alternate airport.

These tables are established for:
- Go-around: 100 kg or 220 lb
- Climb profile: 250 kt/300 kt/M .78
- Long range speed
- Descent profile: M .78/300 kt/250 kt
- Approach and landing at alternate airport: 120 kg or 270 lb (4 min)
- ISA
- CG = 33 %
- Normal air conditioning
- Anti ice OFF.

Note: *1. In the tables, the asterisk (*) means that a step climb of 4 000 ft must be flown to reach the corresponding flight level.*
2. The flight level shown on the top of each column is the final flight level.
3. For each degree Celsius above ISA temperature apply a fuel correction of
0.015 (kg/°C/NM) x ΔISA (°C) x Air distance (NM)
or 0.033 (lb/°C/NM) x ΔISA (°C) x Air distance (NM)

GENERAL

Ident.: PER-FPL-FLP-ALN-20-00001832.0008001 / 02 MAR 11

[2] **Applicable to: MSN 01957-02359, 02405-02482, 02609-02670, 02737-03071, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

The alternate planning tables enable the flight crew to determine the fuel consumption and time required to cover a given air distance from go-around at destination airport to landing at alternate airport.

These tables are established for:
- Go-around: 100 kg or 220 lb
- Climb profile: 250 kt/300 kt/M .78
- Long range speed
- Descent profile: M .78/300 kt/250 kt
- Approach and landing at alternate airport: 80 kg or 180 lb (4 min)
- ISA
- CG = 33 %
- Normal air conditioning
- Anti ice OFF

Note: *1. In the tables, the asterisk (*) means that a step climb of 4 000 ft must be flown to reach the corresponding flight level.*
2. The flight level shown on the top of each column is the final flight level.
3. For each degree Celsius above ISA temperature apply a fuel correction of
0.015 (kg/°C/NM) × ΔISA (°C) × Air distance (NM)
or 0.033 (lb/°C/NM) × ΔISA (°C) × Air distance (NM)

GENERAL

Ident.: PER-FPL-FLP-ALN-20-00001832.0009001 / 25 FEB 14
Applicable to: MSN 01767-01920, 02388, 02584, 02712, 03138, 03750, 04294, 04314, 04393-04438, 04510

The alternate planning tables enable the flight crew to determine the fuel consumption and time required to cover a given air distance from go-around at destination airport to landing at alternate airport.

These tables are established for:
- Go-around: 100 kg or 220 lb
- Climb profile: 250 kt/300 kt/M .78
- Long range speed
- Descent profile: M .78/300 kt/250 kt
- Approach and landing at alternate airport: 80 kg or 180 lb (4 min)
- ISA
- CG = 33 %
- Normal air conditioning
- Anti ice OFF

Following tables have been calculated using databases for CFM 56–5–B /P. If the engines fitted on the aircraft are not /P or /3, the fuel consumption has to be increased by 3 %.

Note: *1. In the tables, the asterisk (*) means that a step climb of 4 000 ft must be flown to reach the corresponding flight level.*
2. The flight level shown on the top of each column is the final flight level.
3. For each degree Celsius above ISA temperature apply a fuel correction of 0.015 (kg/°C/NM) x ΔISA (°C) x Air distance (NM) or 0.033 (lb/°C/NM) x ΔISA (°C) x Air distance (NM)

CORRECTION FOR DEVIATION FROM REFERENCE WEIGHT

Ident.: PER-FPL-FLP-ALN-20-00001834.0001001 / 28 FEB 11
Applicable to: ALL

The alternate planning tables are based on a reference landing weight at alternate.
The fuel consumption must be corrected when the landing weight is different from the reference landing weight.
If it is lower (or greater) than the reference weight, subtract (or add) the value given in the correction part of the table per 1 000 kg or 1 000 lb below (or above) the reference weight.

GENERAL

Ident.: PER-CLB-GEN-00001982.0001001 / 15 FEB 11
Applicable to: ALL

Climb tables are established at MAX CLIMB THRUST with air conditioning in normal mode and anti ice OFF.

The climb speed profile is :
- 250 kt from 1 500 ft up to FL 100
- acceleration from 250 kt to 300 kt
- climb at 300 kt then M .78 up to selected altitude.

All charts are established with a center of gravity corresponding to 33 %.

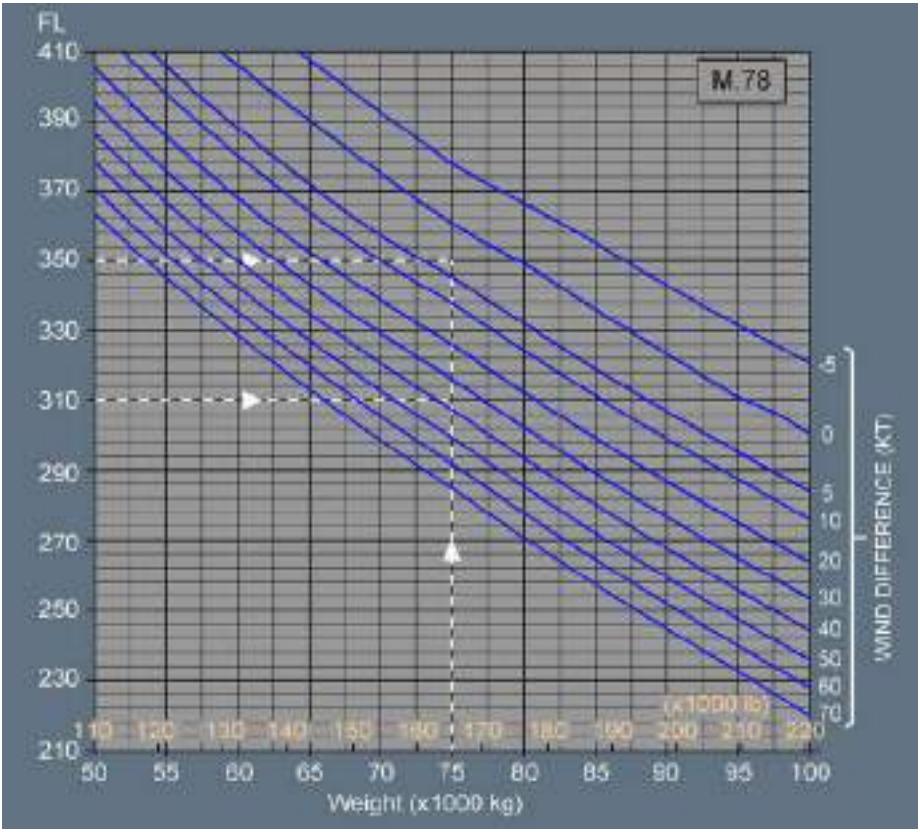
DEFINITIONS

Ident.: PER-CRZ-ALT-10-00001995.0001001 / 22 MAR 17
Applicable to: ALL

- Optimum altitude : the altitude at which the airplane covers the maximum distance per kilogram (pound) of fuel (best specific range). It depends on the actual weight and the deviation from ISA.
- Maximum altitude is defined as the lower of:
  - maximum altitude at maximum cruise thrust in level flight and
  - maximum altitude at maximum climb thrust with 300 ft/min vertical speed.

Refer to QRH/PER-M Optimum & Maximum Altitudes (Paper Only) or use the performance application of FlySmart with Airbus.
The QRH charts are established for a center of gravity at 33 % MAC.
Maximum and optimum altitudes are given for different temperatures at long range speed and M 0.78.



Note: *1. The n = 1.3 g (n = 1.4 g) curve indicates the buffet margin.*
2. Definition of the maximum altitude in the FMGC is different (Refer to DSC-22_20-50-10 MCDU).

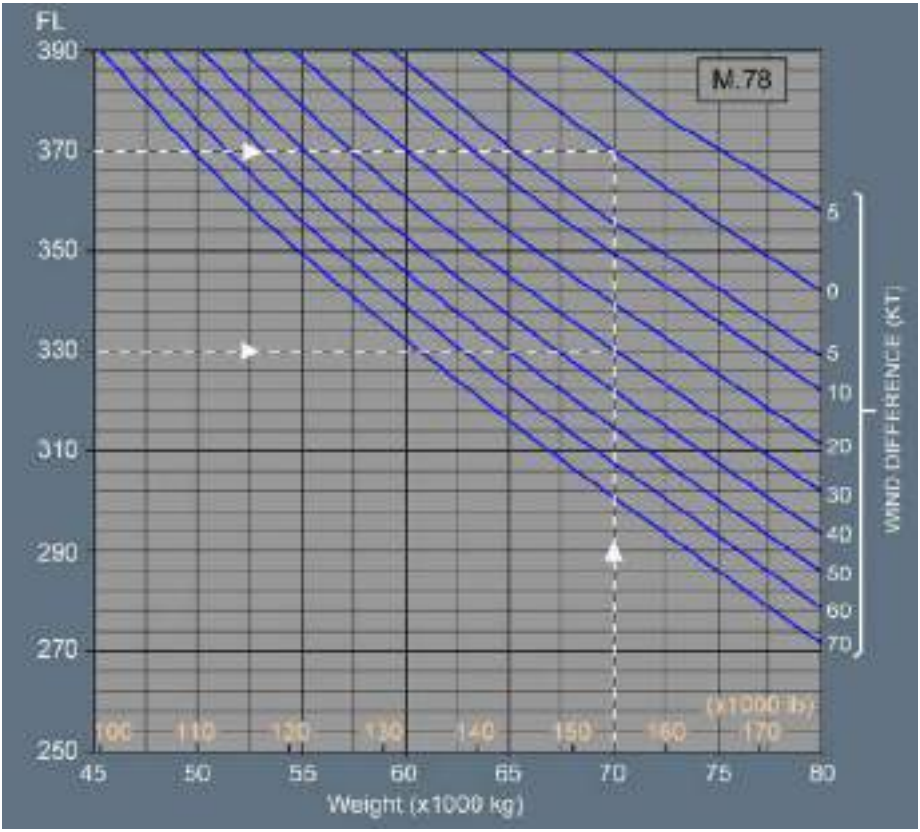
WIND ALTITUDE TRADE FOR CONSTANT SPECIFIC RANGE

Ident.: PER-CRZ-ALT-20-00001998.0039001 / 30 OCT 18

[1] **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

GIVEN : Weight : 75 000 kg (165 340 lb)
Wind at FL 350 : 10 kt head



FIND : Minimum wind difference to descend to FL 310 : (37 - 4) = 33 kt

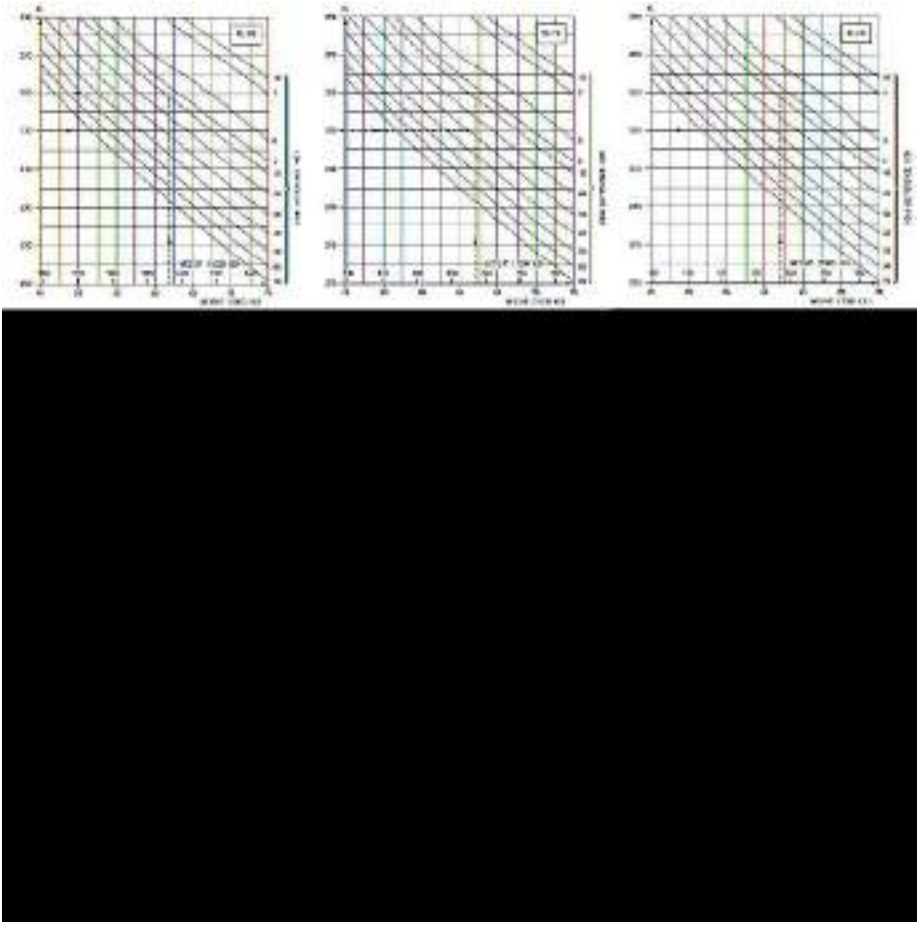
RESULTS : Descent to FL 305 may be considered provided the tail wind at this altitude is more than (33 - 10) = 23 kt.

WIND ALTITUDE TRADE FOR CONSTANT SPECIFIC RANGE

Ident.: PER-CRZ-ALT-20-00001998.0036001 / 16 MAR 15

[2] **Applicable to: MSN 06720-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

GIVEN : Weight : 70 000 kg (143 300 lb)
Wind at FL 370 : 10 kt head



FIND : Minimum wind difference to descend to FL 330 : (30 - 0) = 30 kt

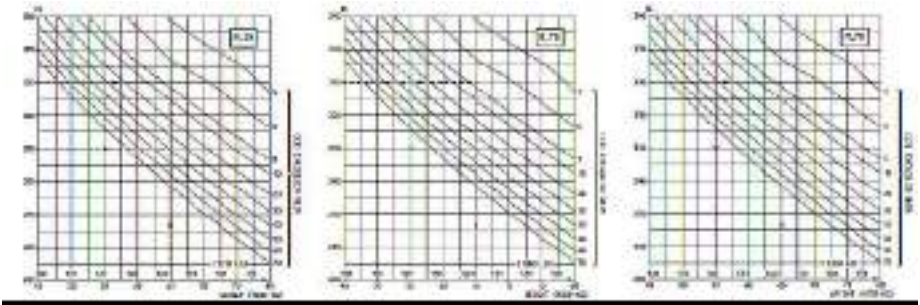
RESULTS : Descent to FL 330 may be considered provided the tail wind at this altitude is more than (30 - 10) = 20 kt.

WIND ALTITUDE TRADE FOR CONSTANT SPECIFIC RANGE

Ident.: PER-CRZ-ALT-20-00001998.0008001 / 10 DEC 09

[3] **Applicable to: MSN 01957-02359, 02405-02482, 02609-02670, 02737-03071, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-06336**

GIVEN : Weight : 62 000 kg (136 700 lb)
Wind at FL 350 : 10 kt head



FIND : Minimum wind difference to descend to FL 330 : (27 - 7) = 20 kt

RESULTS : Descent to FL 330 may be considered provided the tail wind at this altitude is more than (20 - 10) = 10 kt.

WIND ALTITUDE TRADE FOR CONSTANT SPECIFIC RANGE

Ident.: PER-CRZ-ALT-20-00001998.0007001 / 10 DEC 09

Applicable to: MSN 01767-01920, 02388, 02584, 02712, 03138, 03750, 04294, 04314, 04393-04438, 04510

[redacted]

GIVEN : Weight : 65 000 kg (143 300 lb)
Wind at FL 350 : 10 kt head

FIND : Minimum wind difference to descend to FL 310 : (40 - 4) = 36 kt

RESULTS : Descent to FL 310 may be considered provided the tail wind at this altitude is more than (36 - 10) = 26 kt.

In cruise, a quick check table (*Refer to QRH/PER-M In Cruise Quick Check at a Given Mach Number (Paper Only)* or use the performance application of FlySmart with Airbus) allows the flight crew to determine the fuel consumption and the time required to cover a given air distance from any moment in cruise to land.

The QRH table is established for:
- Cruise Mach number: M 0.78
- Descent profile: M 0.78/300 kt/250 kt
- Approach and landing: 120 kg or 270 lb -6 min IMC
- ISA
- CG = 33 %
- Normal air conditioning
- Anti ice OFF

Note: *1. In the table, the asterisk "*" means that a step climb of 4 000 ft has been made to reach the corresponding flight level.*
2. The flight level shown on the top of each column is the final flight level.
3. For each degree celsius above ISA apply a fuel correction of
0.005 (kg/°C/NM) x ΔISA (°C) x Air Distance (NM)
or 0.011 (lb/°C/NM) x ΔISA (°C) x Air Distance (NM)

GENERAL

CORRECTION FOR DEVIATION FROM REFERENCE WEIGHT

Ident.: PER-CRZ-ICQ-10-00002039.0001001 / 22 MAR 16

Applicable to: ALL

The in cruise quick check table is based on a reference initial weight.
The fuel consumption must be corrected when the actual weight is different from the reference initial weight.
If it is lower (or greater) than the reference weight, subtract (or add) the value given in the correction part of the table per 1 000 kg or 1 000 lb below (or above) the reference weight.

EXAMPLE FOR THE QRH USE

Ident.: PER-CRZ-ICQ-20-00014741.0001001 / 22 MAR 17
Applicable to: ALL

The following data and graphs are for example only, and are not for operational use. Even if the data in the following example is in “kg” and “m”, the same method can be applied for “lb” and “ft”.

In-cruise quick check with cruise at M.78

FL 370

Actual cruise weight : 55 000 kg

Remaining ground distance : 800 NM

ISA +10

Average wind during flight : -40 kt (head wind)

- Evaluation of air distance to be covered
  - Use the “Ground Distance/Air Distance” conversion table (*Refer to PER-OPD-CON-AEO M.78*)

LOW AIR CONDITIONING	ENGINE ANTI ICE ON	TOTAL ANTI ICE ON
ΔFUEL = -0.5 %	ΔFUEL = + 1 %	ΔFUEL = + 3 %

Fuel consumption : 4 053 kg
Time needed : 2 h 07 min

- Correction due to real in cruise weight of 55 000 kg
  - Δ fuel consumption : -51 kg per 1 000 kg below reference
  - Δ fuel : -51 × (60 - 55) = -255 kg
- Temperature correction :
  - Δ fuel consumption : +0.005 kg per 1 °above ISA and per 1 NM Air distance
  - Δ fuel : +0.005 × 10 × 880 = 44 kg

RESULT

Fuel : 4 053 - 255 + 44 = 3 842 kg

Time : 2 h 07 min

Holding table contains information about the total fuel flow that allows the flight crew to plan holding and reserve fuel requirements.
It is established for flight in a race track holding pattern in clean configuration at green dot speed.
This chart is established with air conditioning in normal mode and the center of gravity at 33 %.

GENERAL

Ident.: PER-DES-GEN-00002131.0001001 / 09 DEC 09
Applicable to: ALL

Descent tables are established for normal descent speed M .78 / 300 kt /250 kt and emergency descent at MMO/VMO with airbrakes extended, down to 1 500 ft with :

- Normal air conditioning
- CG = 33 %
- Anti ice OFF

For normal descent, cabin vertical speed is limited to 350 ft/min

Intentionally left blank

GENERAL

Ident.: PER-GOA-GEN-00002140.0001001 / 28 JAN 11

[1] **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

In the go around configuration corresponding to the all engine procedure, the minimum steady gradient one engine inoperative required by the regulations is 2.1 % at a speed not exceeding 1.4 Vs. This requirement is also called approach climb performance by regulations.
The following tables allow to determine the go around limiting weight which satisfies the required gradient with the certified go around configurations 3 and 2.
The required gradient of 2.1 % is considered at the airport reference altitude. The power setting is “GO AROUND” thrust with the air conditioning ON. The speed is 1.23 Vs of the specified configuration. For the occasional cases where approach climb performance is found restrictive, a correction is given for an increased speed, up to 1.4 Vs.

Note: *Landing climb performance (2 engines running) is never limiting.*

3 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

According to airport pressure altitude and temperature determine if the slats/flaps setting must be restricted as a function of the landing weight, in order to meet the go around gradient requirement of 2.1 %.

Establish the final approach configuration with one more step of flaps. If the approach is interrupted, retract the flaps by one step during the go-around.

In case of category 2 and 3 approaches, AIR OPS requires a regulatory approach climb gradient of 2.5 % to be maintained.

Use the tables for CAT II & III approaches to determine the maximum approach climb limiting weight according to airport pressure altitude and temperature.

Note:

1. *If circumstances dictate, landing may be made at a weight corresponding to the maximum structural takeoff weight. (Refer to PRO-ABN-MISC [QRH] OVERWEIGHT LANDING).*
2. *When icing conditions are predicted during the flight and TAT is 10 °C or below and there is an evidence of significant ice accretion, to take into account ice formation on the non heated structure:*
   - *Decrease the approach climb limiting weight by 7.1 %*
   - *The minimum speed is:*
     - *VLS + 5 kt in CONF FULL*
     - *VLS + 10 kt in CONF below FULL*

   For Landing Performance assessment, refer to QRH PER-A.
3. *In the following tables corrections for anti ice are only valid for OAT lower than 10 °C.*
4. *Use the CAT II tables in case of CAT III approach calculation.*

PROCEDURE

GENERAL

Ident.: PER-LDG-GEN-00013287.0001001 / 19 APR 17
Applicable to: ALL

REQUIRED LANDING DISTANCE (RLD) AT DISPATCH

The RLD is the regulatory reference to be used for dispatch landing performance computation.

The RLD is the factored certified landing distance based on:
- Maximum manual braking initiated immediately after main gear touchdown
- Prompt selection of max reverse thrust, maintained to 70kt, and idle thrust to full stop (when credit is used)
- Antiskid and all spoilers operative
- The regulatory dispatch factor.

MANUAL LANDING

CONTAMINATED RUNWAY

If the surface is contaminated, EU-OPS operators must use the longer of the RLD for wet runway and the RLD for the applicable contaminant for dispatch.

AUTOMATIC LANDING

The RLD for automatic landing is defined as the RLD in manual landing corrected with the increment given in AFM. These increments assume maximum manual braking from main gear touchdown.

IN-FLIGHT LANDING DISTANCE

The flight crew should use the Landing Distances published in the QRH as the reference for In-Flight landing performance computation. The In-Flight Landing Distances reflect the performance achievable in a typical operational landing without margin, assuming realistic airborne phase from threshold to touchdown and deceleration on ground to full stop.

The In-Flight Landing Distances consider:
- Airborne phase of 7 seconds from threshold to touchdown
- Maximum manual braking initiated immediately after main gear touchdown
- Normal system delays in braking activation in case of autobrake
- Prompt selection of max reverse thrust, maintained to 70kt, and idle thrust to full stop (when credit is used)
- Antiskid and all spoilers operative.

FACTORED IN-FLIGHT LANDING DISTANCE

The flight crew should apply an appropriate margin to the In-Flight Landing Distances published in the QRH to account for operational variability (e.g. in wind and runway condition reporting) and flying technique (e.g. speed and height above threshold, flare).

This factor should account for:
- The Applicable Regulations
- The Airline Policy
- The discretion of the Pilot.

The Factored In-Flight Landing Distance may in some cases, and in particular on contaminated runway, exceed the RLD considered at dispatch.
The requirements for dispatch remain unchanged and are based on the RLD. However, when arrival conditions are expected to be marginal it is recommended to make a preliminary calculation of In-Flight Landing Distance or Factored In-Flight Landing Distance at dispatch in order to nominate suitable destination alternates.

DISPATCH

Ident.: PER-LDG-GEN-00013288.0001001 / 18 MAR 11
Applicable to: ALL

The pilot must check before departure that the available runway length at destination is at least equal to the required landing distance for the forecasted landing weight.
In case of aircraft system failure affecting landing distance known before the dispatch, the available runway length must be at least equal to the required landing distance with failure, i.e. the required landing distance without failure multiplied by the coefficient given in the Flight Manual or the MMEL.

USE OF THE AUTOBRAKE SYSTEM

Ident.: PER-LDG-GEN-00012045.0001001 / 22 MAY 12
Applicable to: ALL

The autobrake system is designed to help the pilot in case of :
- aborted takeoff or
- landing on short runways or
- operation with low visibility weather conditions

Furthermore, it ensures a straight roll-out and optimizes the landing distance on contaminated runways provided the contamination is evenly distributed.

At landing, select the braking mode according to :
- runway length
- configuration
- runway condition

Intentionally left blank

GENERAL

Ident.: PER-LDG-CTA-10-00013002.0001001 / 21 JUL 14
Applicable to: ALL

This section presents the recommendations of Airbus for operations from wet runways or from runways which are covered with contaminants such as standing water, slush or snow.

Intentionally left blank

DEFINITIONS

Ident.: PER-LDG-CTA-20-00013004.0001001 / 31 AUG 17
Applicable to: ALL

DAMP	:	A runway is considered as damp, when the surface of the runway is not dry, but the water on the surface does not cause a shiny appearance.
WET	:	A runway is considered as wet, when the surface of the runway has a shiny appearance due to a thin film of water. When this film does not exceed 3 mm, there is no significant danger of hydroplaning.
FROST	:	The deposit of ice crystals on the runway is referred to as frost. The direct sublimation of humidity contained in the air on a runway, when the surface temperature is below freezing, causes frost.
COMPACTED SNOW	:	The maintenance personnel use a snow groomer to compress snow on a runway in order to obtain a hard surface.
SLIPPERY WHEN WET:		Notice to Airmen (NOTAM) report a runway as "slippery when wet", when the runway partially or entirely fails to satisfy the minimum (regulatory) friction requirement of the responsible authority.
DRY SNOW	:	Dry snow is snow that, if compacted by hand, does not stay compressed when released. The wind can blow dry snow. The density of dry snow is approximately 0.2 kg/l (1.7 lb/US Gal).
WET SNOW	:	Wet snow is snow that, if compacted by hand, stays compressed when released, and with which snowballs can be created. The density of wet snow is approximately 0.4 kg/l (3.35 lb/US Gal).
STANDING WATER	:	Standing water occurs due to heavy rain and/or insufficient runway drainage with a depth of more than 3 mm.
SLUSH	:	Slush is snow soaked with water, which spatters when stepped on firmly. Slush occurs at temperatures around 5 °C and has a density of approximately 0.85 kg/l (7.1 lb/US Gal).
ICE (Cold and Dry)	:	Situation in which ice occurs on the runway in cold and dry conditions.
WET ICE	:	When the ice on a runway melts, or there are loose/fluid contaminants on top of the ice, the ice is referred to as "wet ice". When there is wet ice on a runway, braking and directional control are difficult or not possible, because the runway surface is very slippery.

EQUIVALENCES

Ident.: PER-LDG-CTA-20-00014917.0002001 / 21 JUL 14
Applicable to: ALL

For the below-listed reported contaminants, the following equivalent runway conditions can be retained for the landing performance determination.

Reported contaminant		Equivalent Runway Condition
Type of contaminant	Depth of contaminant	
Slush	≤ 3 mm (1/8 in)	Wet
Water		
Wet snow		
Dry snow		

RUNWAY CONDITION ASSESSMENT MATRIX FOR LANDING

EXAMPLE

Ident.: PER-LDG-DIS-RLD-00014743.0001001 / 29 JUL 16
Applicable to: ALL

EXAMPLE 1

The following data and graphs are for example only, and are not for operational use. Even if the data in the following example is in “kg” and “m”, the same method can be applied for “lb” and “ft”.
Required Landing Distance (RLD) determination with multiple corrections

Data: Landing CONF = CONF FULL
LW = 58 T
DRY runway
Airport altitude = 2 000 ft
Approach speed = VLS
5 kt TW
ISA conditions
No slope

Read the reference distance for 58 T from RLD table:

Required Landing Distances (m)					
Runway State / Weight (1000 kg)	Dry	Wet	Compacted snow	Slush	Standing Water
46	1 150	1 320	1 310	1 300	1 350
50	Do not use for operational purpose				
54	1 260	1 450	1 480	1 480	1 530
58	1 320	1 510	1 560	1 570	1 630
62	1 380	1 580	1 640	1 670	1 750
66	1 480	1 710	1 730	1 760	1 880

RLD (DRY, 0 ft, VLS, no wind) = 1 320 m

Read the different corrections:

Corrections on Landing Distances (m)						
Runway State		Dry	Wet	Compacted snow	Slush	Standing Water
Altitude	Per 1 000 ft ABOVE SL	+ 60	+ 70	+ 90	+ 130	+ 140
Speed	Per 5 kt	+ 100	+ 100	+ 80	+ 110	+ 160
Wind	Per 5 kt TW	+ 140	+ 170	+ 150	+ 220	+ 300
Reverse	Per Thrust Reverser Operative	-	-	- 90	- 90	- 110
CG	Extended Forward CG	+ 30	+ 30	+ 40	+ 40	+ 50

Altitude correction: 60 x 2 = +120 m
Wind correction: 140 x 1 = +140 m

RLD (DRY, 2 000 ft, VLS, 5 kt TW) = 1 320 + 120 + 140 = 1 580 m

EXAMPLE 2

Required Landing Distance (RLD) calculation with WET CHECK (Mandatory for EASA operators)

Data: Landing CONF = CONF FULL
LW = 58 T
Runway covered with STANDING WATER
Airport altitude = 2 000 ft
Approach speed = VLS
Credit for all thrust reversers
ISA conditions
No slope

Required Landing Distances (m)					
Runway State / Weight (1000 kg)	Dry	Wet	Compacted snow	Slush	Standing Water
46	1 150	1 320	1 310	1 300	1 350
50	1 210	1 390	1 400	1 390	1 440
54	1 260	1 450	1 480	1 480	1 530
58	1 320	1 510	1 560	1 570	1 630
62	1 380	1 580	1 640	1 670	1 750
66	1 480	1 710	1 730	1 760	1 880

Corrections on Landing Distances (m)						
Runway State		Dry	Wet	Compacted snow	Slush	Standing Water
Altitude	Per 1 000 ft ABOVE SL	+ 60	+ 70	+ 90	+ 130	+ 140
Speed	Per 5 kt	+ 100	+ 100	+ 80	+ 110	+ 160
Wind	Per 5 kt TW	+ 140	+ 170	+ 150	+ 220	+ 300
Reverse	Per Thrust Reverser Operative	-	-	- 90	- 90	- 110
CG	Extended Forward CG	+ 30	+ 30	+ 40	+ 40	+ 50

RLD (WATER, 2 000 ft, VLS, no wind, all reversers) = 1 630 + 140 x 2 - 110 x 2 = 1 690 m

Compare this distance to the landing distance in the same conditions on WET runway:
RLD (WET, 2 000 ft, VLS, no wind) = 1 510 + 70 x 2 = 1 650 m

RLD (WET) < RLD (WATER), therefore RLD = 1 690 m

REQUIRED LANDING DISTANCE AT RIO SANTOS DUMONT (SBRJ/SDU)

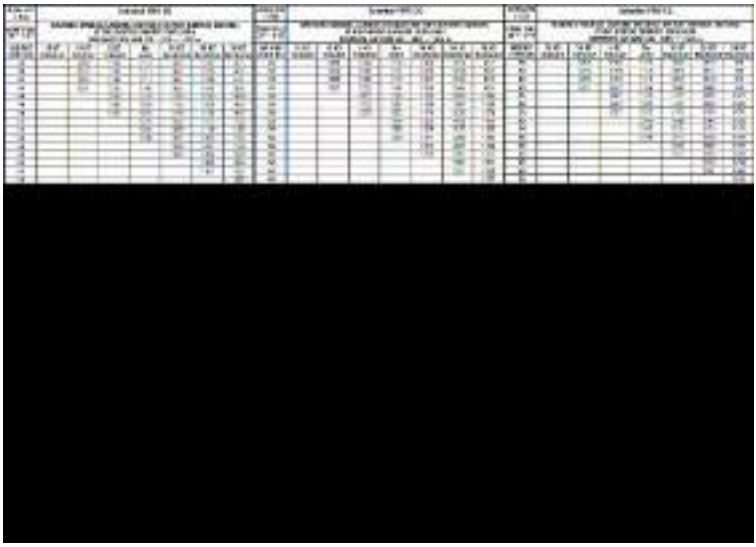
INTRODUCTION



The following tables show the required landing distances on wet runway at Santos Dumont airport (SBRJ/SDU) for A320-232/-233 fitted with BSCU STD 8 (or higher standard). The use of these tables is subject to a Flight Manual supplement. The performance on wet runway given in these tables is applicable provided the runway is maintained to acceptable standards for Porous Friction Course type runways in accordance with FAA AC 150/5320-12 or CAA CAP 683 or equivalent

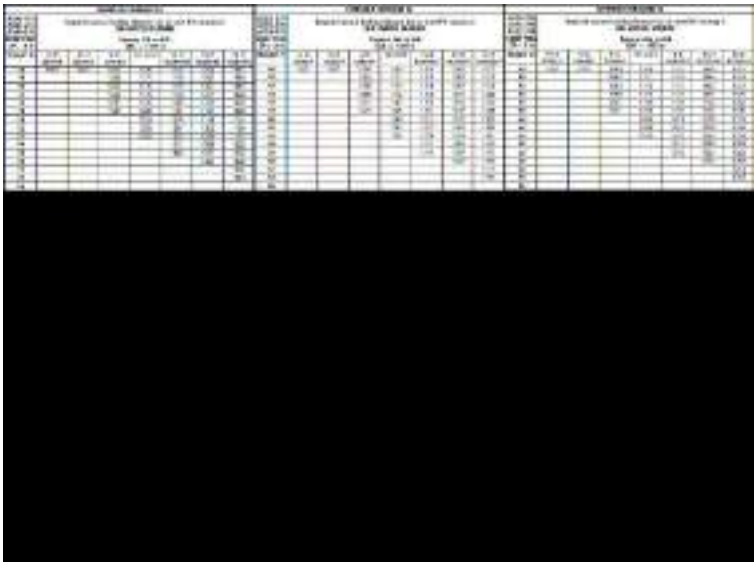
INTRODUCTION



The following table shows the required landing distances on wet runway at Santos Dumont airport (SBRJ/SDU) for A320-214/-215/-216 aircraft models fitted with BSCU STD 9 or L4.1 (or higher versions). The use of this table is subject to a specific Flight Manual Supplement. The performance on wet runway given in this table is applicable provided the runway is maintained to acceptable standards for Porous Friction Course type runways in accordance with FAA AC 150/5320-12 or CAA CAP 683 or equivalent.

AUTOMATIC LANDING ON DRY RUNWAY

Ident.: PER-LDG-DIS-RLA-00013359.0688001 / 21 NOV 17

1 **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

Determine the corrected required landing distance for manual landing from the data above.
The required landing distance for automatic landing is equal to the corrected required landing distance for manual landing except in the following cases.

- **If landing weight is equal to or below 60 000 kg (132 280 lb):**

  The required landing distance for automatic landing is equal to the corrected required landing distance for manual landing increased by:
  - 190 m (624 ft) for landing in CONF 3
  - 102 m (337 ft) for landing in CONF FULL.

- **If landing weight is above 60 000 kg (132 280 lb) and equal to or below 70 000 kg (154 320 lb):**

  The required landing distance for automatic landing is equal to the corrected required landing distance for manual landing increased by:
  - 90 m (297 ft) for landing in CONF 3
  - 69 m (226 ft) for landing in CONF FULL.

- **If landing weight is above 70 000 kg (154 320 lb) and landing in CONF FULL:**
  The required landing distance for automatic landing is equal to the corrected required landing distance for manual landing increased by 85 m (280 ft).

AUTOMATIC LANDING ON DRY RUNWAY

Ident.: PER-LDG-DIS-RLA-00013359.0641001 / 16 NOV 15

2 **Applicable to: MSN 06720-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

Determine the corrected required landing distance for manual landing from the data above.

The required landing distance for automatic landing is equal to the corrected required landing distance for manual landing except in the following case:
- In case of landing in CONF FULL with headwind, it is equal to the corrected required landing distance for manual required landing increased by 170 m.

AUTOMATIC LANDING ON DRY RUNWAY

Ident.: PER-LDG-DIS-RLA-00013359.0023001 / 18 MAR 11

Applicable to: MSN 01767-01920, 02388, 02584, 02712, 03138, 03750, 04294, 04314, 04393-04438, 04510

Determine the corrected required landing distance for manual landing from the data above.

The required landing distance for automatic landing is equal to the corrected required landing distance for manual landing except in the following case:

- In case of landing in CONF 3 with landing weight equal to or less than 55 000 kg and with no wind or headwind, it is equal to the corrected required landing distance for manual required landing increased by 95 m.
- In case of landing in CONF FULL with landing weight equal to or less than 70 000 kg it is equal to the corrected required landing distance for manual required landing increased by 90 m.

AUTOMATIC LANDING ON DRY RUNWAY

Ident.: PER-LDG-DIS-RLA-00013359.0191001 / 18 MAR 11

3 **Applicable to: MSN 01957-02121, 02138, 02195-02359, 02405-02482, 02609-02670, 02737-03071, 03264-03618, 03782-04216, 04312, 04328-04384, 04481-04506, 04518-05411**

Determine the corrected required landing distance for manual landing from the data above.

The required landing distance for automatic landing is equal to the corrected required landing distance for manual landing except in the following case:

- In case of landing in CONF 3 with landing weight equal to or less than 65 000 kg and with headwind at or above 10 kt, it is equal to the corrected required landing distance for manual landing increased by 90 m.
- In case of landing in CONF FULL with landing weight equal to or less than 45 000 kg and with headwind at or above 30 kt, it is equal to the corrected required landing distance for manual landing increased by 10 m.

AUTOMATIC LANDING ON DRY RUNWAY

Ident.: PER-LDG-DIS-RLA-00013359.0205001 / 18 MAR 11
Applicable to: MSN 02135, 02139

Determine the corrected required landing distance for manual landing from the data above.

The required landing distance for automatic landing is equal to the corrected required landing distance for manual landing except in the following case:

- In case of landing in CONF 3 with landing weight equal to or less than 65 000 kg and with headwind at or above 10 kt, it is equal to the corrected required landing distance for manual landing increased by 285 ft.
- In case of landing in CONF FULL with landing weight equal to or less than 45 000 kg and with headwind at or above 30 kt, it is equal to the corrected required landing distance for manual landing increased by 25 ft.

AUTOMATIC LANDING ON DRY RUNWAY

Ident.: PER-LDG-DIS-RLA-00013359.0596001 / 21 DEC 12
Applicable to: MSN 05437-06336

Determine the corrected required landing distance for manual landing from the data above.

The required landing distance for automatic landing is equal to the corrected required landing distance for manual landing except in the following case:

- In case of landing in CONF 3 with landing weight equal to or less than 50 000 kg and with headwind at or above 25 kt, it is equal to the corrected required landing distance for manual landing increased by 40 m.

Intentionally left blank

INTRODUCTION

Ident.: PER-OEI-GEN-00002064.0001001 / 10 DEC 09
Applicable to: ALL

This chapter provides the single engine performance data to be used for the conduct and monitoring of the flight following an engine failure.
The diversion strategy (descent and cruise speed schedules) shall be selected, and specified in the operator's routes specifications, as a function of the prevailing operational factors (e.g. obstacles clearance requirements and/or ETOPS operation).

FLIGHT PREPARATION

Ident.: PER-OEI-GEN-00002065.0001001 / 01 DEC 14
Applicable to: ALL

In readiness for a possible engine failure occurring during the flight, any flight shall be planned so as to comply with any of the following requirements, as applicable :

- obstacle clearance,
- oxygen,
- maximum diversion distance (ETOPS operation).

The following FCOM sections provide flight preparation and fuel planning information :

- *Refer to PER-FPL-GEN-MFR MINIMUM RECOMMENDED FUEL REQUIREMENTS*, for Standard Fuel Planning,
- *Refer to PRO-SPO-40-10 General*, for Extended Range Operation (ETOPS) and associated fuel requirements.

STRATEGY

Ident.: PER-OEI-GEN-00002067.0001001 / 23 NOV 11
Applicable to: ALL

Depending on the prevailing operational constraints, the most appropriate diversion strategy shall be selected, out of the following options:

	STANDARD STRATEGY	OBSTACLE STRATEGY	FIXED SPEED STRATEGIES	
			320 kt	VMO
DESCENT TO CEILING	• M .78/300 kt • MCT	• Green Dot Speed • MCT	• M .78/320 kt • MCT	• M .80/350 kt • MCT
CRUISE	LR ceiling LR speed	- Obstacle not cleared: Maintain Green Dot Speed at MCT - Obstacle cleared : Revert to standard strategy	FL per *Refer to PRO-SPO-40-60 ETOPS Fuel Requirement from Critical Point to Landing - One Engine Out - Cruise at 320kt* MCT/320 kt	FL per *Refer to PRO-SPO-40-60 ETOPS Fuel Requirement from Critical Point to Landing - One Engine Out - Cruise at 350kt* MCT/350 kt
DESCENT TO LANDING	IDLE/M .78/300 kt/250 kt			
Approx increase in fuel consumption compared with both engines operative	+33 %			

For ETOPS operations, any of the above diversion strategies can be used provided that the selected strategy and speed schedule is used in:

- establishing the area of operation (maximum diversion distance), *Refer to PRO-SPO-40-60 General*,
- calculating the diversion fuel requirements for the single engine ETOPS critical scenario, *Refer to PRO-SPO-40-30 ETOPS Fuel Scenarios*,
- demonstrating the applicable obstacle clearance requirements (net flight path and net ceiling).

During the diversion, the flight crew is expected to use the planned speed schedule.
However, based on the evaluation of the actual situation, the pilot in command has the authority to deviate from this planned one engine inoperative speed.

CEILINGS

Ident.: PER-OEI-ALT-10-00016065.0001001 / 22 MAR 17
Applicable to: ALL

Refer to QRH/PER-L Ceilings (Paper Only) or use the performance application of FlySmart with Airbus.

In cruise quick check tables (*Refer to QRH/PER-L In Cruise Quick Check Long Range (Paper Only)* or use the performance application of FlySmart with Airbus) allow the flight crew to determine the fuel consumption and the time required to cover a given air distance from any moment in cruise to landing, with one engine inoperative.

The QRH tables are established for:
- Cruise Mach number : long range
- Descent profile : M .78/300 kt/250 kt
- Approach and landing : 120 kg or 270 lb - 6 min IMC
- ISA
- CG = 33 %
- Pack flow HI
- Anti ice OFF

Note: *1. In the tables, the asterisk (*) means that a step climb of 4 000 ft must be flown to reach the corresponding flight level.*
2. The flight level shown on the top of each column is the final flight level.
3. For each degree Celsius above ISA temperature apply a fuel correction of 0.015 (kg/°C/NM) x Δ ISA (°C) x air distance (NM) or 0.033 (lb/°C/NM) x ΔISA (°C) x air distance (NM).

IN CRUISE QUICK CHECK AT LONG RANGE SPEED

Ident.: PER-OEI-ICQ-10-00002122.0003001 / 22 MAR 17

[2] **Applicable to: MSN 08557, 08587, 08655, 08710, 08768, 09063**

In cruise quick check tables (*Refer to QRH/PER-L In Cruise Quick Check Long Range (Paper Only)* or use the performance application of FlySmart with Airbus) allow the flight crew to determine the fuel consumption and the time required to cover a given air distance from any moment in cruise to landing, with one engine inoperative.

The QRH tables are established for :

- Cruise Mach number : long range
- Descent profile : M .78/250 kt/300 kt
- Approach and landing : 140 kg or 340 lb -6 min IMC
- ISA
- CG = 33 %
- Normal air conditioning
- Anti ice OFF

Note: *1. In the tables, the asterisk (*) means that a step climb of 4 000 ft must be flown to reach the corresponding flight level.*

2. The flight level shown on the top of each column is the final flight level.

3. For each degree Celsius above ISA temperature apply a fuel correction of 0.015 (kg/°C/NM) × Δ ISA (°C) × air distance (NM) or 0.033 (lb/°C/NM) × ΔISA (°C) × air distance (NM).

CORRECTION FOR DEVIATION FROM REFERENCE WEIGHT

Ident.: PER-OEI-ICQ-10-00002123.0001001 / 21 MAR 17

Applicable to: ALL

The in cruise quick check tables are based on a reference initial weight.

A correction on the fuel consumption has to be made, when the actual initial weight is different from the reference initial weight.

If it is lower (or greater) than the reference weight, subtract (or add) the value given in the correction part of the table per 1 000 kg or 1 000 lb below (or above) the reference initial weight (*Refer to PER-OEI-DES-20 DESCENT - M.80/350KT*).

GENERAL

Ident.: PER-OEI-ICQ-20-00002125.0001001 / 14 NOV 11

1 **Applicable to: MSN 01767-08541, 08558-08586, 08627-08654, 08688-08702, 08737, 08771-09045**

The following in cruise quick check tables allow the flight crew to determine the fuel consumption and the time required to cover a given air distance from any moment in cruise to landing with one engine inoperative.

These tables are established for:

- Cruise speed: MCT/VMO, MCT/320 kt.
- Descent profile: M .78/300 kt/250 kt
- Approach and landing: 120 kg or 270 lb - 6 min IMC
- ISA
- CG = 33 %
- Pack flow HI
- Anti ice OFF

Note: *1. In the tables, the asterisk "*" means that a step climb of 4 000 ft has been made to reach the corresponding flight level.*

2. The flight level shown on the top of each column is the final flight level.

3. For each degree Celsius above ISA apply a fuel correction of
0.015 (kg/°C/NM) x ΔISA (°C) x Air Distance (NM)
or 0.033 (lb/°C/NM) x ΔISA (°C) x Air Distance (NM)

GENERAL
